VOLVME CXXVII

JVLY-DEC 1924

THE BVILDER

AN : ILLUSTRATED : WEEKLY JOURNAL : FOR : THE : ARCHITECT : AND : CONSTRUCTOR.

"EVERY man's proper mansion-house, and home, being the theater of his hospitality, the seate of selfe-fruition, the comfortablest part of his own life, the noblest of his sonne's inheritance, a kind of private princedome, nay, to the possessors thereof, an epitome of the whole world, may well deserve, by these attributes, according to the degree of the master, to be decently and delightfully adorned." - - - - - - -

"Architecture can want no commendation, where there are noble men, or noble mindes."

—SIR HENRY WOTTON.

"OUR English word TO BUILD is the Anglo-Saxon Byldan, to confirm, to establish, to make firm and sure and fast, to consolidate, to strengthen; and is applicable to all other things as well as to dwelling-places."—DIVERSIONS OF PURLEY. - - - - -

"ALWAYS be ready to speak your mind, and a base man will avoid you."—WILLIAM BLAKE. - -

THE BUILDER

A JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

VOL. CXXVII.—No. 4218. JULY 4, 1924.

THE FREEDOM OF HOLLAND

THOSE who were privileged to hear the most interesting paper read recently before the Royal Institute of British Architects by Dr. D. F. Slothower, upon the subject of "Modern Dutch Architecture," must have felt that there was being revealed to them a true expression of a very vital people, but of one whose national characteristics were of a very different nature to our own. Obvious vitality, extreme cleverness, and aspiration tinged with not a little of impatience, are not the uppermost signs of the typical British temper, and can find no startling expression in our national art. Vital as we are—and we must be so indeed if our Empire is itself to be explained—we do not wear the badge upon the sleeve, and we prefer to revel in the type of the slumbering lion. Were we poseurs, we should pose in the armchair. Neither do we lay claim to extreme cleverness, and our aspirations are things of the innermost heart, and of which we are reluctant to speak.

If, however, we are to understand at all Dr. Slothower's people—and it is necessary for our education that we should—we have to shake off that deadening, insular tolerance which we are apt to assume with some condescension; to become very wide awake, put aspiration against aspiration, and have the greatest sympathy with that spirit of impatience which, more often than not, is in itself a virtue. We have to lay aside the habit of taking everything once established for granted, before we can begin to enter into the spirit with which the modern Dutch school is inspired.

When we remember some of the wonderful feats of endurance and achievement carried out by just ordinary men during the war, we must at times wonder how much the network of daily habit, convention, respectability, and what not, hang round the neck as a dead load, and how much it serves its avowed purpose of protection. Habit should be the impulse which forgoes thought that thought may be turned to more useful purpose. Convention should be the unwritten law designed to co-ordinate individual action and give it a common purpose, and thus eliminate the clashing of individual interests. Respectability should be a concern for the susceptibilities of neighbours, that their attention may not be diverted through our oddities. Yet when once these institutions were swept aside the soldier seemed to show that the 90 lbs. pack was less of a burden.

Dr. Slothower's paper, like a waft of fresh air in a stuffy room, must have appealed to many as the opening up of a clear vista of freedom. Here was Youth dancing for joy and yet serious and looking far ahead in the utmost earnestness. Our national state in things architectural seemed in comparison a very dull thing indeed.

Habit has told the Englishman that the shopfront must not appear to stand upon a sheet of glass. The Dutchman revels in the miracle and piles up his bricks upon the void. "Why not?" says he. "We all know your mighty stone lintel is bolted to a girder, and your stout stone piers are but so many jackets round as many stanchions. Why not glory in your power, rather than assume the impotence of a fettered past?" Can we answer him in spirit as well as in words?

Convention tells us that we must lay our bricks flat—it is the way they always have been laid, and we all do it so. The Dutchman stands a brick on end upon the table and says, "Why not that way if I like?" Respectability demands a certain acceptance of the established order, and yet the Dutchman asks, "Of what service?"

Here we have had presented for our consideration an entirely new thing, so free from all preconceptions that we feel rather at a loss for the language in which to discuss it. We may well ask:—

First, is this a live movement and has it taken root, or is it all artificial? Can it be an offering to the thirsty God of Change, who will demand further and repeated sacrifices?

Second, can this movement spread to this country and in its present form, or can a national movement on parallel lines develop here?

He will be a wise man who can answer as time will answer, much as we shall each try to foretell. To ourselves, it appears to be a very live and vital movement, and an integral part of the political and social life of the Dutch people, but whether this passion for the "new" will be reflected in a long series of upsets, each getting so far and no farther, who can tell? That it should spread to England in its present form, we can only say, "God forbid!" It is Dutch and Dutch alone, and can make no universal appeal other than for a disinterested sympathy in its aims. It will bear no more the transplanting than will the dead styles of the past. Those who expect a repetition of the conditions that lead to the strong Dutch influence that has marked our domestic architecture in the past must remember that this was the accompaniment to a widespread influx of Dutch immigrants, a state of affairs that is not likely to be repeated in an overcrowded country that can no longer offer its hospitality to an unlimited number of foreigners. That there should be a parallel movement in this country towards freedom of thought, we must all devoutly hope and expect, but its expression must be as national as the work of which Dr. Slothower spoke to us.

It is a far call from Amsterdam to Wembley, yet not so far in spirit if we can read into the character of many of the new exhibition buildings there, a fresh attempt to express the function of new materials in a new way. That this has been done without a shock to our susceptibilities is merely a sign of that stability that is the keynote of our national temperament, and the trend of national thought will be directed thither rather than out of the country.

We are perhaps a little slow to move, but our momentum is steady and irresistible. Where others bound forward at a touch, as to give the impression that we have been hopelessly left, we groan a little at the impulse, but nevertheless move slowly ahead, so frequently to meet again the pioneers, returning wearied from some dead by-pass up which they have hurled themselves, and relieved to find once more the dull main road.

In the meantime we like to understand our neighbours and to learn from them, and those of us who listened to Dr. Slothower's paper with a free and open mind can feel that we have indeed had a holiday away from the humdrum.

We return from it a little bewildered, a little envious, and a little anxious. Bewildered, because there is so little in common with ourselves, to which we may anchor down our own ideas; envious, because of the young enthusiasm that is so little apparent among us; anxious in the sense that a parent may fear for the son who has left the home influence. What dangers he may meet? Can he resist them?

Perhaps the worst thing that can happen to the modern Dutch movement is that it should become the fashion to copy in other countries. If it escapes this fate it should live on to maturity, but otherwise it may be smothered.

NOTES

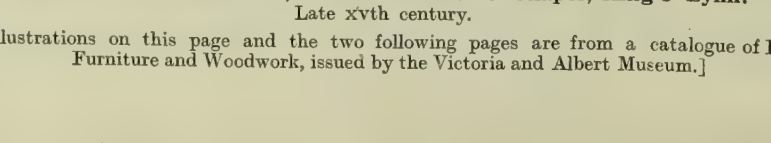
The Channel Tunnel.

THE project of the Channel Tunnel has been kept before the public with great energy and ability for some forty years, and the latest record in the form of an address to the Prime Minister reflects the general aspect of the scheme in a clearly summarised form. Lord Sydenham maintains that from the military point of view we should reap very great advantages, whilst the political and commercial advantages may be taken for granted. Sir Percy Tempest, the engineer to the scheme, estimates the present cost at twenty-one million pounds, and the time required for the whole work at about four-and-a-half years. It certainly appears that this great work might go through at once if the ghost of a possible national danger can be effectually laid. The direct link which it would supply from London to the whole world outside these islands must seem to many who have studied the matter as of inestimable value. Viscount Cowdray said, in March last, "I assume we all believe that any doubts as to the feasibility of the tunnel, or as to its paying a good return on the cost when it is made do not exist any longer. The only question which has to be solved is to get the Government to agree that no particular reasons—military or otherwise—are sufficiently great to prevent the Tunnel being constructed."

Lighting of Art Galleries.

IT is strange that a correspondent in our last issue, writing upon the proposed second Manchester Art Gallery Competition, should refer to the "top lighting" and "side lighting" of art galleries, but should make no mention of the "top-side" method of lighting, so ably advocated by Mr. Hurst Seager, and adopted with success in the Art Gallery at Wanganui, in New Zealand. In one of Mr. Seager's papers upon the subject, read before the R.I.B.A., he shows by diagram how this method can be successfully applied to a two-storied building, thus suggesting the fullest effective value to be gained out of a congested site without reverting to simple side lighting. There is no doubt that Mr. Seager's method is rapidly gaining adherents, and that it merits the serious study of all interested in this subject.

The Lay Press.



APPRECIATION of architecture is on the increase. Many of our leading newspapers include architecture among the subjects normally discussed in leading articles and elsewhere. We would like to see this movement spread. How often does one read leading articles, especially in minor journals, which show clearly that they are only stop-gaps, dealing as they do with some trivial detail or a subject of faint momentary interest? It matters little if the views expressed concerning architecture are unorthodox, or even wrong. We could at least tap a new source of legitimate interest and curiosity for the reader to consider, to criticise, or to contradict.

Building Advertisements.

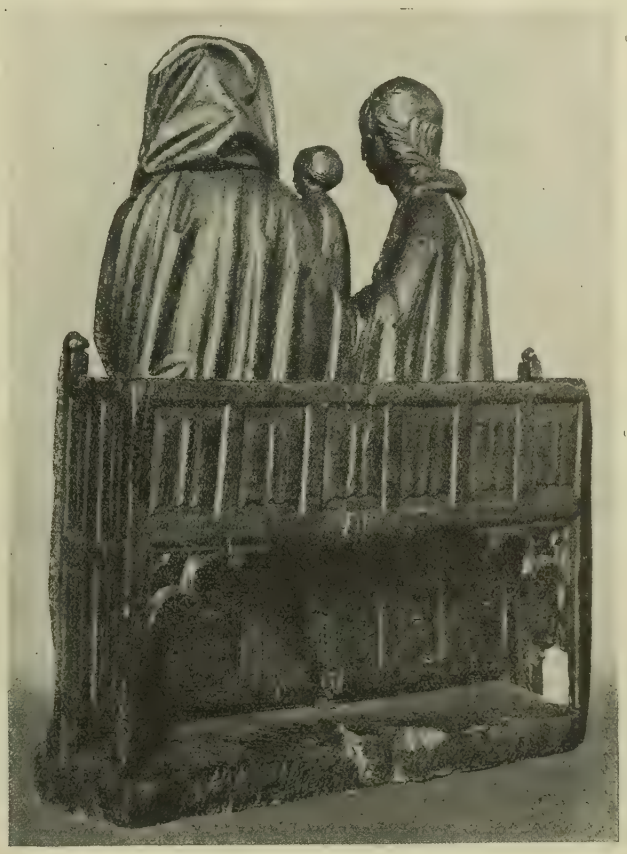
A NO less healthy sign is the improvement visible in the advertisements of building materials. If, for example, a house is illustrated, it is now exceptional to find a stereotyped "villa"; we see, on the contrary, good lettering and well-drawn perspectives or elevations of reasonable architecture, embodying the qualities of imagination, with the result that architects are gradually gaining the habit of looking through the advertisements in the Press to the benefit of advertiser and architect alike. This benefit is, of course, recognised by the live advertiser, and the example cannot fail to be followed by his less enterprising competitor who, although he may know nothing of architecture himself, can still employ someone who does to design his building advertisements for him. We understand that the advertisement agent is now largely entrusted with the responsibility of production, and probably the public gain thereby; but we would remind these specialists that architecture also has its own technique, and that still more help might be enlisted from many brilliant young architectural draughtsmen.

A Guild for Street Decoration

THE aim to promote a common spirit among shopkeepers so that instead of cut-throat competition there should arise a more co-operative aim among them, towards more congenial and artistic surroundings, avoiding vulgarity and over self-assertion, is one to be welcomed. A Guild has been formed among the shopkeepers of Church-street, Kensington, a pleasant and in parts old-world thoroughfare running between Kensington High-street and Notting Hill Gate, the aim of which is to improve the appearance of the street, by the erection of artistic shop signs, more becoming treatment of shop fronts, and by any other means whereby the street may be made more attractive and its characteristics preserved. It is encouraging to learn that such a scheme is afoot which, well directed, and as its influence extends, should effect much in the way of improvement in our London streets. And it is more possible to effect such improvements in the quieter streets not yet wholly in possession of huge mercantile emporiums, and should emphasise the charm that lingers in these less hustling areas. The value of art to commerce is becoming better understood, and the shopkeepers of Church-street in uniting to preserve the character and amenities of their thoroughfare are doing a public service as well as helping themselves. An account in the press informs us that the Guild consists at present of fifty-eight members, and has enlisted the sympathy of a good many artists, and further assistance is requested from those interested in the movement. Tasteful business premises in tasteful streets, to greet the view of the passer-by, would make all the difference to the pleasure and interest with which we walk in them. So potent is the influence of any contribution towards beauty, for the bettering of life, that we are unconsciously affected, as the improvement in advertising emphasises our objection to vulgar and unsuitable display.

Fragments of Stall-Ends, from St. Nicholas Chapel, King's Lynn.
Late XVth century.

[The illustrations on this page and the two following pages are from a catalogue of English Furniture and Woodwork, issued by the Victoria and Albert Museum.]



Upper Part of a Stall-End, from a Norwich Church.
xvth century.

Street Processions. STREET processions which are becoming more a feature of the time at this period of the summer are very much with us just now, and it is well to consider how they may have added to the gaiety, abundant good fellowship and co-operation which they already include, some features of greater beauty and artistic attractiveness. We watched only recently the passing through a suburban area of a procession stretching continuously for, perhaps, more than half a mile, made of symbolic groups, comic features, corporation dignitaries, local industries, and so on, representing much labour and enthusiasm, yet it could not be said truly that outside the human element itself, which presented many charming features both young and old, that it was possible to discern any approach amidst all its colour and gaiety to sensibility for real beauty or design. Nor perhaps are these processions for philanthropic purposes to be criticised if they fail to include that touch of a little higher sensibility towards beauty, which one misses in them. Yet so much goodwill, energy and expense might well be strengthened by what would give such added charm and interest to them. It is only when the influence of the architect and artist is properly felt that his contribution which could be so helpful can be forthcoming, and we suggest both to the architect and the organisers of these processions that they should consult together on methods by which better results could be achieved. We saw at the time of the Women's Suffrage movement in some of their street processions the difference where design and colour scheme play a more prominent part, and it appears to us that the promoters of these fêtes and processions for hospital and other charities might combine to improve their pageantry in such a good cause. We are glad always to see these processions united by so much good feeling for a cause in common, and could they also charm us with the appeal of a little more beauty an addition to the force of the appeal made through them would, we think, result.

Children and Ugliness. THE leading article in the *Children's Newspaper*, of June 28, contains some excellent straight talking, which we hope will sink into the minds of the coming generation. The following extracts illustrate the welcome rebellion against ugliness, which, sooner or later, must bear fruit: "We are getting on when a responsible member of the Government tells our architects that he would like to supply them with enough dynamite out of the public funds to blow up all the ugly buildings in our towns. . . . He suggested that a building which did not speak to the man in the street was not much good to the man inside. . . . This is excellent, and we have hammered at the idea for some time; but the trouble is that politicians, who grow eloquent in denouncing the squalor of our cities, never seem able to bring themselves to the point when dynamite is ordered, much less applied to the offending evil. We drift on, grumbling, but we do not take off our coats and say, 'Let us make this place beautiful, and that place noble; let us create our greatest works of art in the public streets, for the enjoyment of all and the uplifting of our people.' . . . But it is no use to lament the past. The best thing we can do is to work for the future." If our children can be sufficiently impressed with a desire for pleasant surroundings, they will certainly see that they get them.

The Building Trade Dispute. NOTWITHSTANDING our so-called progress, we are still confronted with the foolish, if not brutal, method of strikes and lock outs. Plenty of wise counsel has been offered to our workers as to the best way of attacking grievances, and some of the best of it has been given by their own leaders. We must all admit that times have changed and that the attitude of the employers of labour is, on the whole, a very near approach to reasonable conciliation. Whilst economic values have to play a major part in the world's affairs, it should be obvious to every man who thinks at all that there comes a point when the balance of profit and loss must be considered. It is true enough that the working man ought to look for a living wage, or even aim for something more, but so long as labour is an important factor in industrial problems, he and all will be compelled to abide by economic considerations.

Group, representing St. Anne, the Virgin and Christ, seated on a panelled bench. Late xvth century.

GENERAL NEWS

Professional Announcement.

[Mr. H. T. B. Barnard has removed his London office to 10, Bedford-row, W.C.1. Telephone: Chancery 7660.]

British School of Archæology.

The annual exhibition of the British School of Archæology in Egypt will be held at University College, Gower-street, from July 4–26.

A National Theatre.

The British Drama League held its fifth annual meeting recently at the British Empire Exhibition, when Mr. J. Alfred Gotch, President of the Royal Institute of British Architects, presented the prizes—as announced in our issue of last week—for the three best designs for a national theatre.

Obituary.

The death took place recently at his residence at Weymouth of Mr. Edwin Seward, F.R.I.B.A., the well-known architect. Mr. Seward was born in 1853 at Yeovil, and during his long professional career he was responsible for many notable buildings in South Wales, Monmouthshire and Cardiff.

French Bricks for Hull.

At a recent meeting of the Hull Works Committee a report presented by the City Engineer stated that in the housing work in the Hessle-road scheme, the number of bricklayers had been reduced, and employment refused because of the lack of bricks. The Committee accepted a British tender for one million bricks, but up to the present time the total quantity delivered had not been sufficient to employ more than 15 or 16 bricklayers. The report stated the best offer received for a real augmentation of the supply was an offer of French bricks, which would mean an extra £400 or £500. The Committee authorised the City Engineer to purchase one million French bricks on the terms mentioned, subject, however, to the Ministry of Health having no objection to their use in the building of subsidy houses.

Barracks for Housing.

The War Office recently refused Plymouth Corporation's request for the use of the ring of ancient forts surrounding the town as working-class dwellings, but is prepared to let them have Elphinstone Barracks at £3 7s. per week rent.

South Wales Institute of Architects.

The first summer visit, arranged by the Institute of Builders (South Wales Branch) jointly with the South Wales Institute of Architects (Central Branch), took place recently. The party met at Cardiff and proceeded by char-à-banc to Castell Coch. Afterwards the party proceeded to "Ty-Gwyn," the residence of Mr. J. E. Turner, J.P. (Chairman of the Institute of Builders, South Wales Branch). A vote of thanks to Mr. and Mrs. Turner was proposed by Mr. A. W. Julian, A.I.O.B., of Pontypridd, seconded by Mr. W. S. Purchon, M.A., A.R.I.B.A.

Peterborough Cathedral.

The Peterborough Cathedral Restoration Committee has just received a report from their architect, Mr. Leslie T. Moore, regarding the state of the roofs of the Cathedral. Mr. Moore states that hitherto proper investigation of the principal roofs of the Cathedral has been impossible owing to the darkness of the roof spaces, but with the installation of electric lighting the condition of the timbers can now be seen. Regarding the Choir roof, which dates from the end of the fifteenth century, the structure is in a precarious condition. Its present state and that of the ceiling is due to destruction by both the Death Watch and smaller beetles, combined with wet and dry rot; added to which the faulty design of the original scheme of construction and subsequent endeavours to correct it, without reframing, have produced such strains on the main timbers that the condition is serious, and the only satisfactory treatment would be a reconstruction with new roof trusses. In view of this report, the Committee has decided to take no further action at present in regard to the repair of the bell tower and rehanging of the bells, but have resolved to carry out the recommendations of the architect as to the roofs, and also to instal electric lighting in the Cathedral for congregational use.

Streatham Town Planning Scheme.

A recent report of the Town Planning (Special) Committee of the L.C.C. states the Council has decided to prepare a town planning scheme in reference to certain land, about 20 acres in extent, in the neighbourhood of Streatham Common. As regards new streets, a lay-out of the greater part of the land in question has already been approved by the Building Acts Committee, and they consider it desirable that the roads already sanctioned by that Committee should be prescribed. With regard to limitation of user, they suggest two divisions, the five acres to the south of "The Rookery" to be reserved as a public open space, and the remainder for residential houses. A general limit of 10 houses to the acre is proposed. As regards the proportion of the plots to be occupied by buildings, the houses in the neighbourhood contain two floors, and occupy about one-third of the plot, and it is considered that this limit should be adopted.

Victoria and Albert Museum.

The Victoria and Albert Museum has recently purchased a writing cabinet, signed "Samuel Bennett, London Fecit." This is an important example of English furniture at the time of Queen Anne, made of walnut wood, with marquetry decoration of arabesque ornament in light wood. The upper part, closed by a door inset with a mirror, framed with fluted pilasters and panels of inlaid ornament, contains a cupboard and shelves, in which the architectural motive suggested in the decoration of the exterior, is cleverly repeated. The lower part, with slope front and drawers, is fitted with a central cupboard flanked by drawers and pigeon-holes. The whole is surmounted by a pediment with carved scrolls and shield. This piece of furniture is of unusual importance from more than one point of view. It is a distinguished example of English furniture of the early part of the eighteenth century marked by high quality of workmanship. The fact that it bears the signature of the maker (inlaid on the inner surface of the door) makes it of particular value as a record, for it was not the usual practice for cabinet makers in England to sign their furniture. Two other signed examples of the work of Samuel Bennett are known, one of which further shows that he lived in Monmouth-square, London. The cabinet is at present exhibited in the West Hall of the Museum, near the main entrance.

Side-Table or Buffet. Early XVIth century.

COMPETITION NEWS

Bexhill Entertainment Hall.

The Bexhill Corporation invite designs from architects in the district for the erection of an entertainment hall. Premiums of £50 and £25 are offered respectively. Sending-in day, September 1.

The conditions of the Bexhill Town Hall Competition are not in accordance with the R.I.B.A. regulations, and members are advised not to take part until they have been revised.

Masonic Memorial.

Designs for rebuilding Freemasons' Hall, Great Queen-street, Kingsway. The competition to be conducted in two stages. Each of the architects submitting a design in the final competition will receive an honorarium of £500. Assessors, Sir Edwin Lutyens, Mr. Walter Cave, Mr. A. Burnett Brown. On receipt of one guinea competitors will receive conditions of the competition, which has the approval of the R.I.B.A., together with block plan of site.

Applications marked "M. M. M. Competition" must be received by The Grand Secretary, Freemasons' Hall, Great Queen-street, London, not later than August 23.

Barton-upon-Irwell Hospital.

The sending-in date for this competition is July 31.

Other Competitions.

Other competitions still open include the following (the dates given are, first the sending-in date, and second the issue of *The Builder* in which full particulars were given):—Ross-Smith Memorial (Sept. 30; Feb. 21). Harrogate Infirmary (Sept. 30; May 30). Hamilton War Memorial (Sept. 1; May 30). Glasgow High School Memorial (Sept. 30; June 13).

MEETINGS

SATURDAY, *July* 5.

Edinburgh Architectural Association.—Visit to Dunfermline Abbey Church.

MONDAY–THURSDAY, *July* 7–10.

Institution of Sanitary Engineers.—International Conference.

MONDAY, *July* 7.

Royal Institute of British Architects.—A Special General Meeting will be held at 5.30 p.m. for the purpose of confirming the resolutions which were passed on June 17.

WEDNESDAY–SATURDAY, *July* 9–12.

R.I.B.A.—The Annual Conference of the Royal Institute of British Architects will take place at Oxford during this period.

On June 30 the discussion took place on the paper which was read by Mr. Charles A. Daubney, F.R.I.B.A., on June 23, on "The Proposed Reform of the London Building Law," which dealt with the recent Report of the Council's, London Building Acts Committee Major Harry Barnes, F.R.I.B.A., presided.

Mr. Searles-Wood, in proposing a vote of thanks to Mr. Daubney, said he had, by the excellence of his paper, put the members almost as *au fait* on the subject as if they had been members of the Committee themselves. They were most anxious that the subject should have full ventilation and discussion. On one point he disagreed with Mr. Daubney: he did not think the Committee could be accused of not desiring to improve buildings in the metropolis. He was not aware that the words in the report, "A healthier and brighter city," were deleted with ribald laughter. The Committee had been anxious to put at the end of the Report a record of their appreciation of the valuable work which Mr. Daubney had accomplished in expressing the views of the Committee: it had been carried through in a masterly fashion. It was not necessary to go into the details of the Report because Mr. Daubney had already covered the ground. He hoped the members present would take the opportunity of saying anything they wished as to improving the Report. Their suggestions would be referred back to the Committee, then to the Council, and finally to the L.C.C.

Mr. Delissa Joseph, in seconding the vote of thanks, said he could not recall an instance in which one could do so with more pleasure than on this occasion. He had been impressed not only by the knowledge Mr. Daubney had shown of the subject, but also by the extraordinary amount of pains and careful work accomplished. The Committee could not have attained its object but for his guidance, and for the ingenious manner in which he analysed the essential points of the Act. Not only had he helped the Committee in its work, but had taken upon himself the drafting of the Report, which by its clarity explained itself. If the Report had a fault it was the absence of reference to what had gone before. For the sake of historical accuracy there should have been some reference to prior work. He (Mr. Joseph) considered he was correct in saying that he had not allowed himself to be biased by the question of higher buildings when dealing with the Report: several suggestions had been incorporated. Under the 1894 Act no road was allowed unless it led from one street to another. The last Crescent-road, prior to the 1894 Act, was made by himself—Chelsea Embankment Gardens; it was completed a few days before the passing of the Act. He would suggest that the matter of three houses forming a road should be modified; it had a restrictive effect on the development of useful sites. With regard to the question of means of escape, although the proper methods were employed, it did not ensure the direction of the audience. They had not attempted to deal with the subject, but it was worth study. On ordinary occasions, in one of the finest theatres in London, he had seen the audience, when dispersing, choose to adopt different directions for their mode of exit; queues of people proceeding north away from the southern exit, and *vice versa*. Something should be done for securing the direction of audiences. Places of public worship were standing menaces to public safety: no adequate means of escape; galleries which made the situation more serious. He had long anticipated that something would be done in a new Act; four staircases were necessary.

With regard to the measurement of old premises before demolition, continued Mr. Joseph, if the plans were mislaid the absence of measured drawings would create a serious difficulty. He suggested a record should be sent to the offices of the L.C.C., so that they could always be found and not lost sight of. Mr. Daubney had said in the case of hotels there was provision for means of escape in a design; but there was nothing to ensure control as to the means of escape being kept clear: it was a vital thing. He had, personally, designed an hotel with ample alternative staircases, but when, after 15 years, he was called in to consider additions to the hotel he was horrified to find that not only were the emergency staircases blocked up with furniture and other material, but at the base of the staircase the door locked inwards. It was essential that means of escape should be kept clear when provided.

With reference to the question of higher buildings, Mr. Daubney had drawn attention to the fact that if an application failed with regard to the height of a building appeal could be made to the tribunal. The original draft of the Report sent up to the Council and adopted by them said that the ratio of 1½ times the width of the street should be established as fixed. Although the principle of 1½ times the width of the street was accepted, it was not necessarily a principle to be definitely incorporated in the Act.

It had been suggested that the question of higher buildings should be referred to the Fine Arts Commission. He was highly opposed to it; it had nothing to do with the Commission at all. Besides, such a step was the thin end of the wedge. The next thing would be that elevations would have to be submitted to the Commission.

There was a provision if an increased height of a building were required it was necessary, in order to get official sanction, that notice should be given to everyone within 100 yards of the building. Mr. Daubney had rightly suggested it should be removed. There had been a case where it had been necessary for an architect to serve notices to over 700 people.

Mr. Daubney had made reference to the fact that his expression "healthier and brighter city" had been deleted. The explanation was that after the ingenuity he had shown in dealing with the subject on practical lines they considered the expression might be considered inappropriate and not consistent with the serious work accomplished. Personally, he considered the suggestions put forward must result in a healthier and brighter London. He was satisfied if certain modifications were introduced in the recommendations it would not only result in a healthier, but also a higher London.

Mr. Horace Cubitt said he thought the Council had not given the subject of Mr. Daubney's paper the attention it deserved; it was not fair to the subject or the paper. It should have been dealt with at an ordinary evening meeting with representatives of the local authorities present. The paper dealt with an important subject, and Mr. Daubney had done a great deal of work in dealing with this most intricate subject in the very clear and concise way he had. The paper dealt with some important points of principle. Hitherto the building lines of London had been carried out in an haphazard manner. Also, there was the question of construction. In London all constructional requirements were in accordance with an Act passed twenty or thirty years ago. They could not get them altered without the Act being amended, whereas any local authority could easily get them altered. As a result they were subject to old-fashioned requirements.

There were, Mr. Cubitt thought, one or two other things the Committee might have considered. First there was the question of air space in office buildings. Office buildings were outside the requirements of air space. It was hardly right it should be so. They should be controlled with regulations as to light and air.

Second, there was the control of elevations. Liverpool had an Act whereby all elevations of new buildings had to be approved by a building authority of the town. He considered it would not be unreasonable if the L.C.C. had power to have elevations submitted to them—applications, of course, to be subject to appeal. If they took Whitehall, for instance, there was nothing to prevent anyone buying a building and putting up any monstrosity they chose.

Sir Henry Tanner said it was ridiculous to make application to the L.C.C. for every trivial variation in construction. Some sort of notice should be issued and made generally known, thereby avoiding repetition. In preparing the Report, the idea had been to aim at principles, leaving details, so that a good deal of work remained to be done.

Mr. W. E. Watson said it was agreed paragraph 10 of the Report would be endorsed by all practising architects. They found the officials of the L.C.C. were inclined to interpret the spirit of the Act and not too literally. With regard to a "Brighter London," they had better tackle the question of the size of fireplaces in ordinary buildings, and thus reduce the smoke which disfigured their cities.

Mr. Arthur Keen said the time of making the Report came at the end of the session, and after full consideration they came to the conclusion that it would be better to have the meeting in the afternoon. The reason why they did not invite the L.C.C. and others outside their own body, was because they wanted to get the views of their own members.

Mr. W. R. Davidge said they were not all unanimous as to the question of higher buildings. They were not generally in favour of buildings over 100 ft. high, although there were cases where such buildings could be put up without harm. Anything unduly high would upset the balance not only of a street but of a whole district.

The Chairman said that, as a member of the Building Committee of the L.C.C., he knew something that went on behind the scenes. The Report, he considered, lost nothing through being concentrated in the hands of a small number of the Committee. Architects were not archæologists, and the Building Law was of more importance than Assyrian art. He congratulated them on the promising stage the Report had reached.

With regard to higher buildings, there was, in the profession, divided views on the matter. He would not say that the attitude of the L.C.C. was that they should not have higher buildings, but many members were against it, and they could not show a united front. When dealing with buildings they were dealing with moneyed interests. Every exception made on behalf of a higher building had some sort of money value; and any exception was a matter of great difficulty for the Building Committee. If they departed from the by-laws as laid down and lent themselves to exceptions they created a precedent on the one hand, and on the other the possibility of complaint from people who did not seize the psychological moment when exceptions were granted. Any proposal about higher buildings, to be acceptable, must be of a detailed character, as when a man had sufficient light and air he considered it a reason for having further stories, and thus obtain increased financial value.

He was very glad to hear from more than one member of the cordial relationship existing between their profession and the officials of the L.C.C. It was a great advantage to have an architectural staff on the L.C.C.; they got a community of interests, and when reports were presented they were looked at from the architect's point of view. If they wished to get the matter through they must simplify it to the last degree for the L.C.C.

Mr. Daubney, in responding, said the Report could not have been accomplished without the co-operation of the Committee.

DRYBURGH ABBEY

By WILLIAM HARVEY.

THE ruins of Dryburgh Abbey stand upon the bank of the Tweed among a grove of cedars and beeches, and the light grey and fawn colour of the masonry is set off to perfection by the deep shade of the foliage. The stonework is in admirable contrast with its background and does not demand any cloak of ivy to render it more picturesque, though, as some of the illustrations show, a tangle of thick unregulated growth had been allowed to disguise the ruin before it passed, for proper care and conservation, into the hands of H.M. Office of Works (Historic Buildings Branch).

Founded at a spot so near the border of the two kingdoms and in the direct line of attack by the English, this offshoot establishment of the Præmonstratensians, White Friars from Alnwick, in Northumberland, has suffered partial demolition several times since its inauguration in 1150. Edward II is reported to have burned the Abbey in 1322; Richard II mutilated it again in 1385, after its restoration at the hands of Robert the Bruce; and it was further affected by the attacks of Sir R. Bowes and Sir Bryan Latoun in 1544, and by the orders of the Earl of Hereford in 1545.

Notwithstanding this succession of disasters, considerable portions of the Abbey church of thirteenth-century work, and of the conventual buildings, dating from the twelfth and fifteenth centuries, have survived, as shown on the plan (Fig. 1).

The north-east crossing pier and adjoining portions of the high wall of the north transept and the presbytery remain to show the nature of the thirteenth-century building. The out-corbelled springings for strong transverse arches, which formerly enclosed the upper part of the square space in the centre of the church, remain in position, with a fragment of vaulting included between them (Fig 2).

This central square appears to have been the only part of the upper works to have been covered with a vault, for the adjoining transept and presbytery walls have clerestories pierced by wall passages and light arcading which makes no adequate provision for the springing or abutment of vaulting. They seem to have been designed for the reception of the feet of an

Figs. 5 and 7 are from Mr. Harvey's sketches. All other illustrations to this article are published by permission of H.M. Office of Works.

FIG. 2.—NORTH TRANSEPT, CONTAINING TOMB OF SIR WALTER SCOTT.

Fig. 5.—Detail of Ruined Stonework, Showing Superficial Smears of Cement.

arched raftered open-timbered roof, or some such covering of lighter weight. Some interesting simple rib and panel vaulting has been preserved over the aisles at a lower level, with a free treatment of the ribs at the corner of the aisle wall. Instead of one diagonal rib starting from the angle, two separate springers have been formed with a pair of ribs rising and converging towards a boss in the centre of the bay. Between the converging ribs, room has been found for a pointed niche outlined with vaulting ribs, which preserve the sequence of wall ribs in adjoining bays with some slight additional emphasis. The retention of this portion of the vaulting is important, not only for its historical and artistic value in itself, but because it supplies a fine blot of shadow behind the arches of the pier arcade, and makes of this part of the ruined church a sufficiently complete canopy above the tombs of famous men placed here, together with that of Sir Walter Scott. Although this may be regarded as the portion of the ruin which had received most care at the hands of former conservators, its dangerous state was demonstrated by the fall of a projecting stone of the presbytery clerestory before even temporary repairs could be undertaken by H.M. Office of Works.

Another part of the ruin which retains its full height is the south gable of the south transept (Fig. 3). Here the twelfth-century and thirteenth-century work are seen in juxtaposition, and the church adjoined the conventual buildings. A round headed arch in the west side of the gable wall and some fragmentary remains of steps mark the position of the night stair leading up from the floor of the church to the dormitory on the first floor of the twelfth-century building. Approach to the church from the dormitory via the cloisters was arranged by means of another doorway opening into the choir aisle, and a stair from cloisters to the first-floor dormitory was contrived at the north end of the calefactory or warming house. This flight was carried over a segmental arch supported by the west wall of the warming house and by a pier projecting from its north end wall. The illustration (Fig. 4) shows this arch covered with a heap of loose rubble and with dirt left after the removal of a heavy growth of ivy, but before repairs had been put in hand. The work had become extremely dilapidated under the system of leaving things to the protection of the ivy, and the mortar had dropped from between the voussoirs which were sagging and broken at their free ends. The dirt has now been carefully cleared away and scraped out of the joints piece by piece and the dangerously drooping stones supported, without alteration in their position, by the insertion of cement mortar tamped in hard in the joints between stone and stone.

The claims of solidity, of antiquarian interest, and of artistic harmony with the ruined appearance of surrounding masses were all adequately met by this judicious treatment.

Dryburgh Abbey has suffered severely from the removal of the squared stones which formed the ashlar facing of the lower parts of the walls. The most accessible stones, which happen to be those at the foot of the wall, always seem to have been chosen for the purpose of quarrying, and time and accident can be depended upon to bring down the rest. Every part of the ruins denuded in this way introduces a question of expediency in repair. What is the most appropriate treatment from both the artistic and the constructional point of view? Each case is judged upon its merits, and where the structure can be retained in equilibrium without the insertion of additional masonry the picturesque old rubble core is carefully consolidated and left to all appearance what it was before, though it is in reality transformed from a loose stone heap to a strongly united mass. The effect of the ruin is just as picturesque after repair, but safety and strength have been preserved, and the gradual but sure wastage due to time and weather are very considerably retarded.

The ruined mass of the south transept gable abounded in minor problems of this sort, and had their solution been attempted by the addition of new facing stones, piers, buttresses, or other external props, very little of the interesting original work would have been

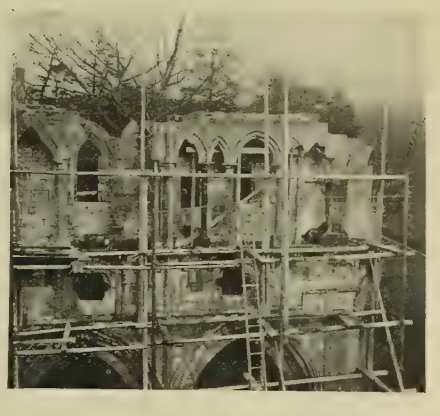

Fig. 9.—North Wall of Presbytery.

preserved to view. The genuine character of the ruins would have been hopelessly lost among the patches of new work, and with it their artistic value would have been altogether destroyed. Traces of one of the historic conflagrations remain upon the southern face of this gable wall, and where the ashlar exists at all it is deeply pitted and seamed with fractures. Some of the blocks have been split into minute fragments, and their condition gave rise to some anxiety as they were liable to wear away and fall to the ground in flakes. This extraordinary condition of things was met by applying the principle of internal consolidation upon a scale adapted to the minute character of the fragments, and the little fire-scarred pieces of stone were retained in position by a process invented for such purposes by the mason in charge of the repairs. An extremely thin coat of Portland cement is spread upon the two faces of stone that it is desired to join together. It is then allowed to get to a certain stage of "set," which can only be judged by experience, and the two parts are then brought into contact. If the right moment has been chosen, the suction of the cement is sufficient to join the

Fig. 6.—East Wall of Eastern Building after Repair.

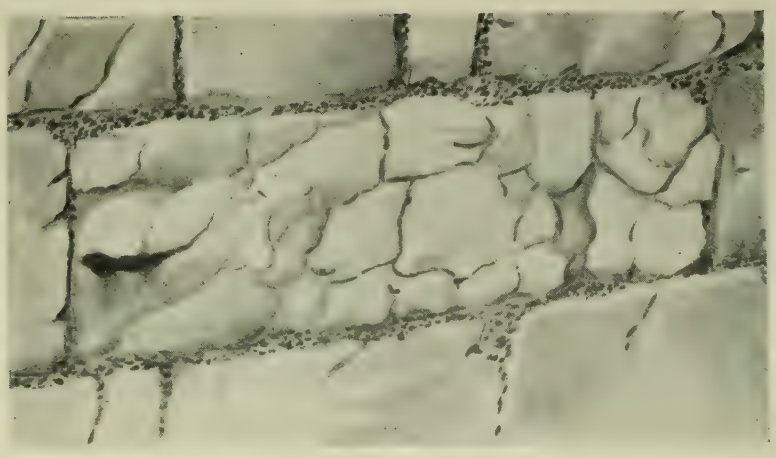

Fig. 7.—Stone Shattered by Fire and Preserved by Skilful Treatment.

stone and make a permanent repair capable of resisting adverse weather conditions. The cement is far more satisfactory than most of the so-called waterproof glues formerly used, but skilful work is necessary to obtain any results whatever. Small projecting pieces of stone that had been re-applied to the face of the building by this means proved capable of withstanding a heavy load though nothing but a faint hair line showed where the repair had been made. A piece of finished repair is seen in Fig. 7 where a stone that had been broken into thirty small pieces has been successfully retained in its position in the wall. Beside the interest of conserving historical evidences, these minor repairs are useful in developing the resources of the masons in mending the dilapidated tracery and mouldings without involving the wholesale demolition of bad parts and the insertion of new material.

Some Norman buttresses from which the lower facing stones had been broken away are shown in Fig. 6. The interior core had been left exposed in a formless and friable heap with the upper courses of facing feebly supported and liable to fall away in successive units or small groups. A glaring patch of new material would have been undesirable, and, as the weights to be carried were not judged to be more than the core could stand, if suitably consolidated, the repair was executed by this means. Each individual joint was cleaned out and cement mortar was forced right into the heart of the wall. The overhanging ashlar above was picked up upon a few courses of rough rubble corbels inconspicuously introduced at the top of the mass of rubble core. A slight difference in scale allows the new work to be recognised for what it is, an ingenious expedient in repair with the least possible intrusion of apparent new work.

Where repairs had been executed prior to the custody of the ruin passing into the hands of H.M. Office of Works, the usual trail of superficial cement pointing was visible. Instead of the cement having been forced in out of sight into joints already scrupulously cleaned for the purpose, it had been lavishly trowelled on in ungainly slabs across the dirt-filled joints and on to the faces of the stonework. In every case examined the cement applied in this manner was found to be cracking off and had parted company with the stonework leaving a trap for moisture and an ideal home for various examples of those less interesting forms of animal life that are found in the clefts of stones in damp places. In some parts this ornamental (?) cement work—for it could hardly be described as useful—had been smeared over wide areas of masonry, and the cement surface had been scored with unsightly lines and dents in attempted imitation perhaps of the rubble stonework hidden beneath. Actually, the appearance (Fig. 5) was as nauseating as the process of application was constructionally inept.

By far the greater part of the ruin had been left untreated to become picturesquely obliterated in a tangle of ivy and the accumulations of soil, twigs, old birds' nests, and other miscellaneous rubbish which gathers upon any surface that does not happen to be steep enough to precipitate it to augment the growing heap of debris about the wall foot.

Many people have proclaimed their love of the ivy mantle upon ancient buildings, but though it is quite possible to recognise their sincerity, it seems more than doubtful whether anything approaching real conservation is possible where large growths are permitted upon the walls. How a ruined building can be repaired and maintained in a state of permanent equilibrium, or even effectively surveyed in a preliminary attempt to discover its strength or weakness, when covered with foliage and dirt has yet to be seen. Hitherto, where the ivy has been retained, the attempts at repair have generally been in the nature of unsightly props and ties and of the superficial cement dabbling described above. It is surely more architectural, as it is certainly sounder construction, to treat the masonry to careful and unobtrusive repair and provide a setting of turf, flowers and foliage in positions where they will frame, and not obscure, the ruined masses of ancient building, and this course has been taken by H.M. Office of Works at Dryburgh Abbey with the very happiest effects.

Fig. 8.—Porter's Lodge and Gable of Frater, showing Excessive Growth of Ivy before Repair.

NEW WATERLOO BRIDGE

AT a meeting of the London County Council last Tuesday, Mr. H. Morrison, M.P. for South Hackney, made the following proposal:—That in view of the totally inadequate width of the present bridge, it be an instruction to the Improvements Committee, in arranging for the reconstruction of Waterloo Bridge, that the roadway shall be of such a width as will provide adequate facilities for general traffic and for the extension of the Council's tramways over the bridge, and that the arches shall be wider than the arches of the old bridge, so that navigation may be facilitated; and further that, having regard to the importance of the project in its relation to London traffic, application be made to the Ministry of Transport for an adequate grant towards the cost of the work."

The Society for the Protection of Ancient Buildings submitted to the Improvement Committee of the L.C.C. a report made to the Society by an engineer detailing a scheme for dealing with Waterloo Bridge which, it is stated, amounts to the replacement of the existing timber foundations by solid concrete and brickwork. It is suggested therein that modern engineering methods admit of this concrete being placed in position under the piers with perfect safety without disturbing a single stone of the existing structure. In submitting this proposal the Society stated that its adviser had not had the advantage of the data which had been collected by the Council, but suggested that if the scheme should prove to be feasible it would result in a great saving of public money and would avoid any interference with traffic. At the request of the Society the Committee interviewed the Secretary of the Society and its adviser. They were informed that the desire of the Society was that the present width of the bridge should be maintained and that the necessity for reconstruction should be avoided, and that it was with this object that the Society had obtained and submitted the report. It was stated that the Society's object in asking for the interview was that it might be placed in possession of the information upon which the Council's advisers had formed their conclusions as to the need for the reconstruction of the foundations.

In their report on April 1, the Committee stated that they were advised that the life of the foundations was coming to an end and that the cheapest way to reconstruct them was to take down the bridge and re-erect it. The question of underpinning was considered, but they were advised by the chief engineer that the type, weight and condition of the bridge and the restricted waterways ruled this method out. This opinion was confirmed at the time by Sir Maurice Fitzmaurice, C.M.G., F.R.S., and Mr. Basil Mott, C.B., who were acting in a consultative capacity.

At their request these advisers have given further consideration to the question of underpinning, particularly with reference to the proposals contained in the report above mentioned. They have submitted a lengthy and reasoned report in which they point out that it has been known for a long time that there are cracks in all the piers of the bridge, that from examination it has been found that in many cases the footings of the piers are very much broken away from the main structure, and that the bridge is in fact showing very general deterioration as the result of old age coupled with exceptional foundation loads and a rather obsolete form of foundation.

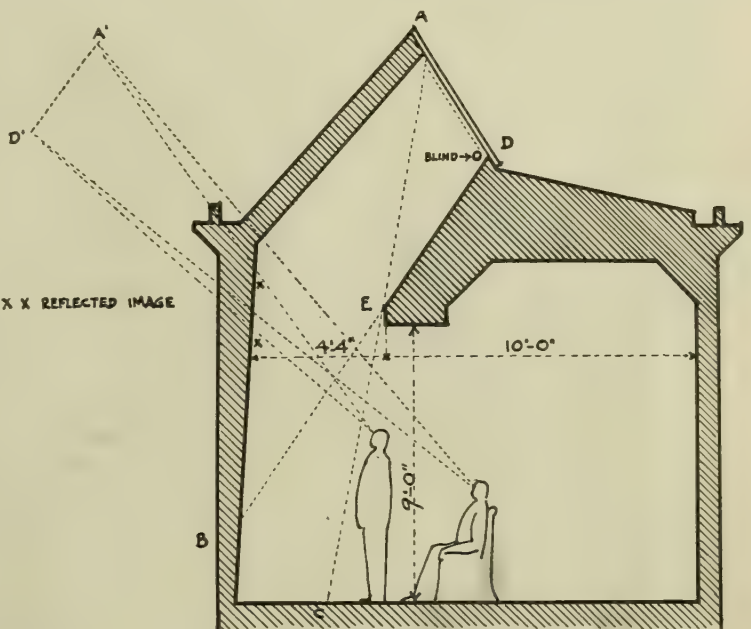
They state that they cannot imagine that the results of underpinning could have any other effect than to increase seriously the difficulties already apparent in the piers and superstructure, and that they are quite unable to agree with the statement that modern engineering methods admit of the concrete being placed in position under the piers with perfect safety without disturbing a single stone of the existing structure. They consider that even if the work could be carried out without serious accident there would be a grave risk to the old superstructure. They state that for the reasons given they are unable to accept the views put forward by the Society, and that they can find nothing which causes them to modify their original opinion that the best method of dealing with the bridge is to rebuild the old superstructure on new foundations put in either in a coffer dam or caisson.

THE LIGHTING OF PICTURE GALLERIES

AT the request of the teaching staff of the Architectural Association, Mr. Hurst Seager delivered to the advanced students of the School a lecture on his system of top-side-lighting for museum and picture galleries.

The subject of satisfactory museum lighting was, he said, one which did not seem to make much headway in this country. The admirable opportunity which the temporary buildings at Wembley would seem to have offered for a full-size experiment in his system had unfortunately been missed, and the results of the recent Hull Art Gallery Competition showed the premiated design to be conceived in the old-fashioned method of top lighting with all its customary defects of reflection and glitter in the pictures. An examination of the Palace of Art galleries at Wembley showed that the clerestory lighting adopted, pleasant enough for unglazed pictures, did not contribute anything towards the problem of reflections in those covered with glass.

In the Sarjeant Art Gallery at Wanganui, New Zealand, designed on the top-side-light principle, the lighting of the pictures was admirable, and Lord Leverhulme, in a recent visit, was so impressed with the fact that he had promised a collection of pictures to the gallery.



The lecturer exhibited a complete series of diagrams and photographs illustrative of his principles; some of these have appeared in the pamphlet reprinted by the R.I.B.A., and others, such as the section showing the lighting proposed for the museum at St. Quentin, to hold La Tours' pastels, are fresh. The success which had attended the adoption of his principles in the Louvre Galleries, which temporarily housed the La Tours, was, he said, convincing. The French press was unanimous in agreeing that the beauties of these pictures were seen, if not for the first time, at least afresh after their sojourn in ill-lit galleries.

Great importance was attached to the type of glass used, a demonstration on the lantern showing the remarkable diffusing qualities of kaleidoscopic glass and the poor properties in this respect of the usual plate glass, which gathered the light into a cross beam across the screen, causing confusing areas of shadow.

Mr. Hurst Seager made a claim only for the correctness of his principles and the ready possibility of their successful application. But he also pointed out that great architectural opportunities were open to this method by a combination of his bay system with larger rooms. There was, he said, a dramatic and beautiful effect of lighting obtainable with this system which would more than compensate for the lofty "architectural" halls in which the embellishments of cove and cap and cornice were seen not only in the flesh but reflected again in the glass of the paintings for which they were supposed to form a setting. No merchant would be willing to display his wares under such unfavourable conditions as were applied to many of the masterpieces in our painting collections.

Victoria and Albert Museum.

The President of the Board of Education has appointed Mr. Eric Robert Dalrymple Maclagan, C.B.E., to succeed Sir Cecil Harcourt Smith, C.V.O., who will retire from the position of Director and Secretary of the Victoria and Albert Museum on September 11. Sir Cecil Harcourt Smith, who was born in 1859, is an honorary F.R.I.B.A. and has held the post of Director and Secretary at the Museum for the last 15 years. Mr. Eric Maclagan has been Deputy Keeper, Department of Architecture and Sculpture at the Museum since 1921.

North Wales Heroes' Memorial.

This building consists of departments for agriculture and natural science at the University of North Wales. It was erected by the North Wales Heroes' Memorial Council, and occupies a frontage of about 700 ft. in Deinial-road, Bangor, and comprises separate blocks for biology, chemistry and physics, each containing some 10,000 sq. ft. of floor area in rooms which include, in addition to lecture rooms, large laboratories and their adjuncts, considerable provision for research workers. Agricultural chemistry and forestry are accommodated behind and attached to the main agricultural building. All these blocks are of one-story. These buildings have one brick wall in white cement, slated roofs, and cement or asphalte floors; the walls internally being sand-lime bricks, unplastered. The main agricultural block, which forms the central feature of the scheme, is of two stories, faced in multi-coloured bricks, Portland stone dressings, and has a flat roof for greenhouses and open-air experimental work.

The contractors are Messrs. J. Laing & Son, Carlisle, and the sub-contractors: Heating, Messrs. G. N. Haden & Sons; electric light, Messrs. Drake & Gorham; fire-proof floors, The Kleine Flooring Co.; steel trusses, Messrs. Young & Co.; windows, Messrs. W. James & Co.; asbestos goods, Messrs. Bell's Asbestos Co.; hydrants, Messrs. Merryweather. Mr. Alan E. Munby, F.R.I.B.A., was the architect.

Deal and Walmer War Memorial Hospital.

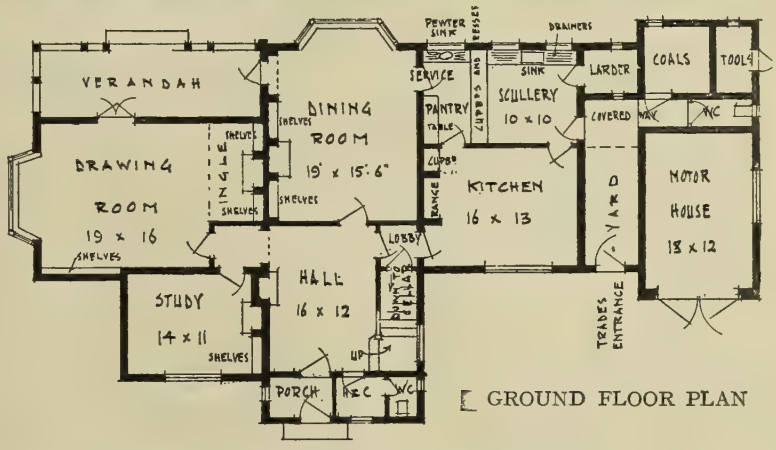
This hospital is designed for twenty-six beds. Each group of wards has its own bath-room and sanitary annexe. A special feature has been made of the memorial entrance hall, which is panelled in teak. On the north side of the hall are the operating room, x-ray room, casualty surgery, dispensary, and porters' rooms. On the north side is the kitchen department with large open roofed kitchen, scullery, larders, and pantry. A separate building contains the mortuary and view chapel, ambulance garage, and rooms for the electric plant.

The whole of the building works were carried out by Messrs. G. H. Denne & Sons, of Deal. The sub-contractors were: Heating, Messrs. Jeffreys; sanitary work, Messrs. Doulton & Co.; teak floors, Messrs. The Acme Wood Block Flooring Co.; terazzo floors, Messrs. The Art Pavements Co.

Messrs. H. P. Adams, C. Holden & L. G. Pearson, FF.R.I.B.A., were the architects.

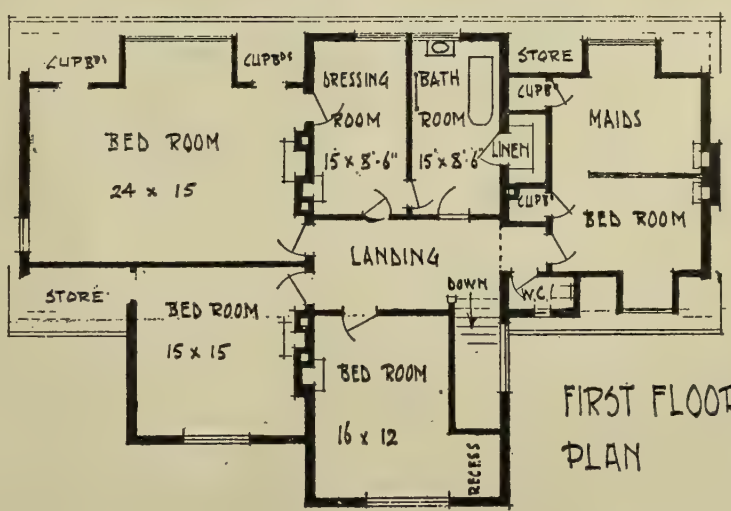
Bank at Chorlton-cum-Hardy.

The materials used in this Bank were sand-faced bricks by Messrs. W. T. Wright & Co., Sileby. The contractors, all of Manchester, were:—General contractors, Messrs. G. Macfarlane & Son, Ltd.; concrete and asphalte work and strong rooms, Messrs. Walter MacDonald & Co., Ltd.; drainage and plumbers' work, Messrs. Wm. Bailey & Co.; heating, Messrs. Saunders & Taylor; electric lighting, Messrs. J. Lomax, Kendal & Co.; tiling, Messrs. Conway & Co.; vents and window hoppers, Messrs. E. Hatton & Co.; patent composition floors, Messrs. Reliance Flooring Co.; grates, etc., Messrs. Wellfire Company; cast lead work, Messrs. G. Wragge, Ltd.; lead lights, Messrs. Leyland & Sons; carving, Messrs. Earp, Hobbs & Miller; fittings, Messrs. John Thomlinson. Messrs. Francis Jones & H. A. Dalrymple, F. and A.R.I.B.A., were the architects.



Bank at Sale.

The materials used in this building were 2-in. sand-faced bricks by the Ravenhead Brick Co. The roof is of pantiles, and the contractors, all of Manchester, were:—Contractors, Messrs. Robert Carlyle & Sons; steelwork, concrete work and strong rooms, Messrs. Walter MacDonald & Co.; steel windows, Messrs. Humphreys, Jackson & Ambler; hoppers and roof vents, Messrs. E. Hatton & Co.; heating, Messrs. G. N. Haden & Sons; electric lighting, Messrs. J. Lomax, Kendal & Co.; composition flooring, Messrs. Reliance Flooring Co.; strong room doors and fittings, Messrs. Chubb & Sons; fittings, Messrs. John Thomlinson; carving, Messrs. Earp, Hobbs & Miller. Messrs. Francis Jones & H. A. Dalrymple, F. and A.R.I.B.A., architects.



Houses, Stratford-on-Avon.

The illustration we give on p. 15 is from the design of Mr. L. L. Dussault, F.R.I.B.A., who has been developing this type of house with "Atlas White" Portland cement stucco.

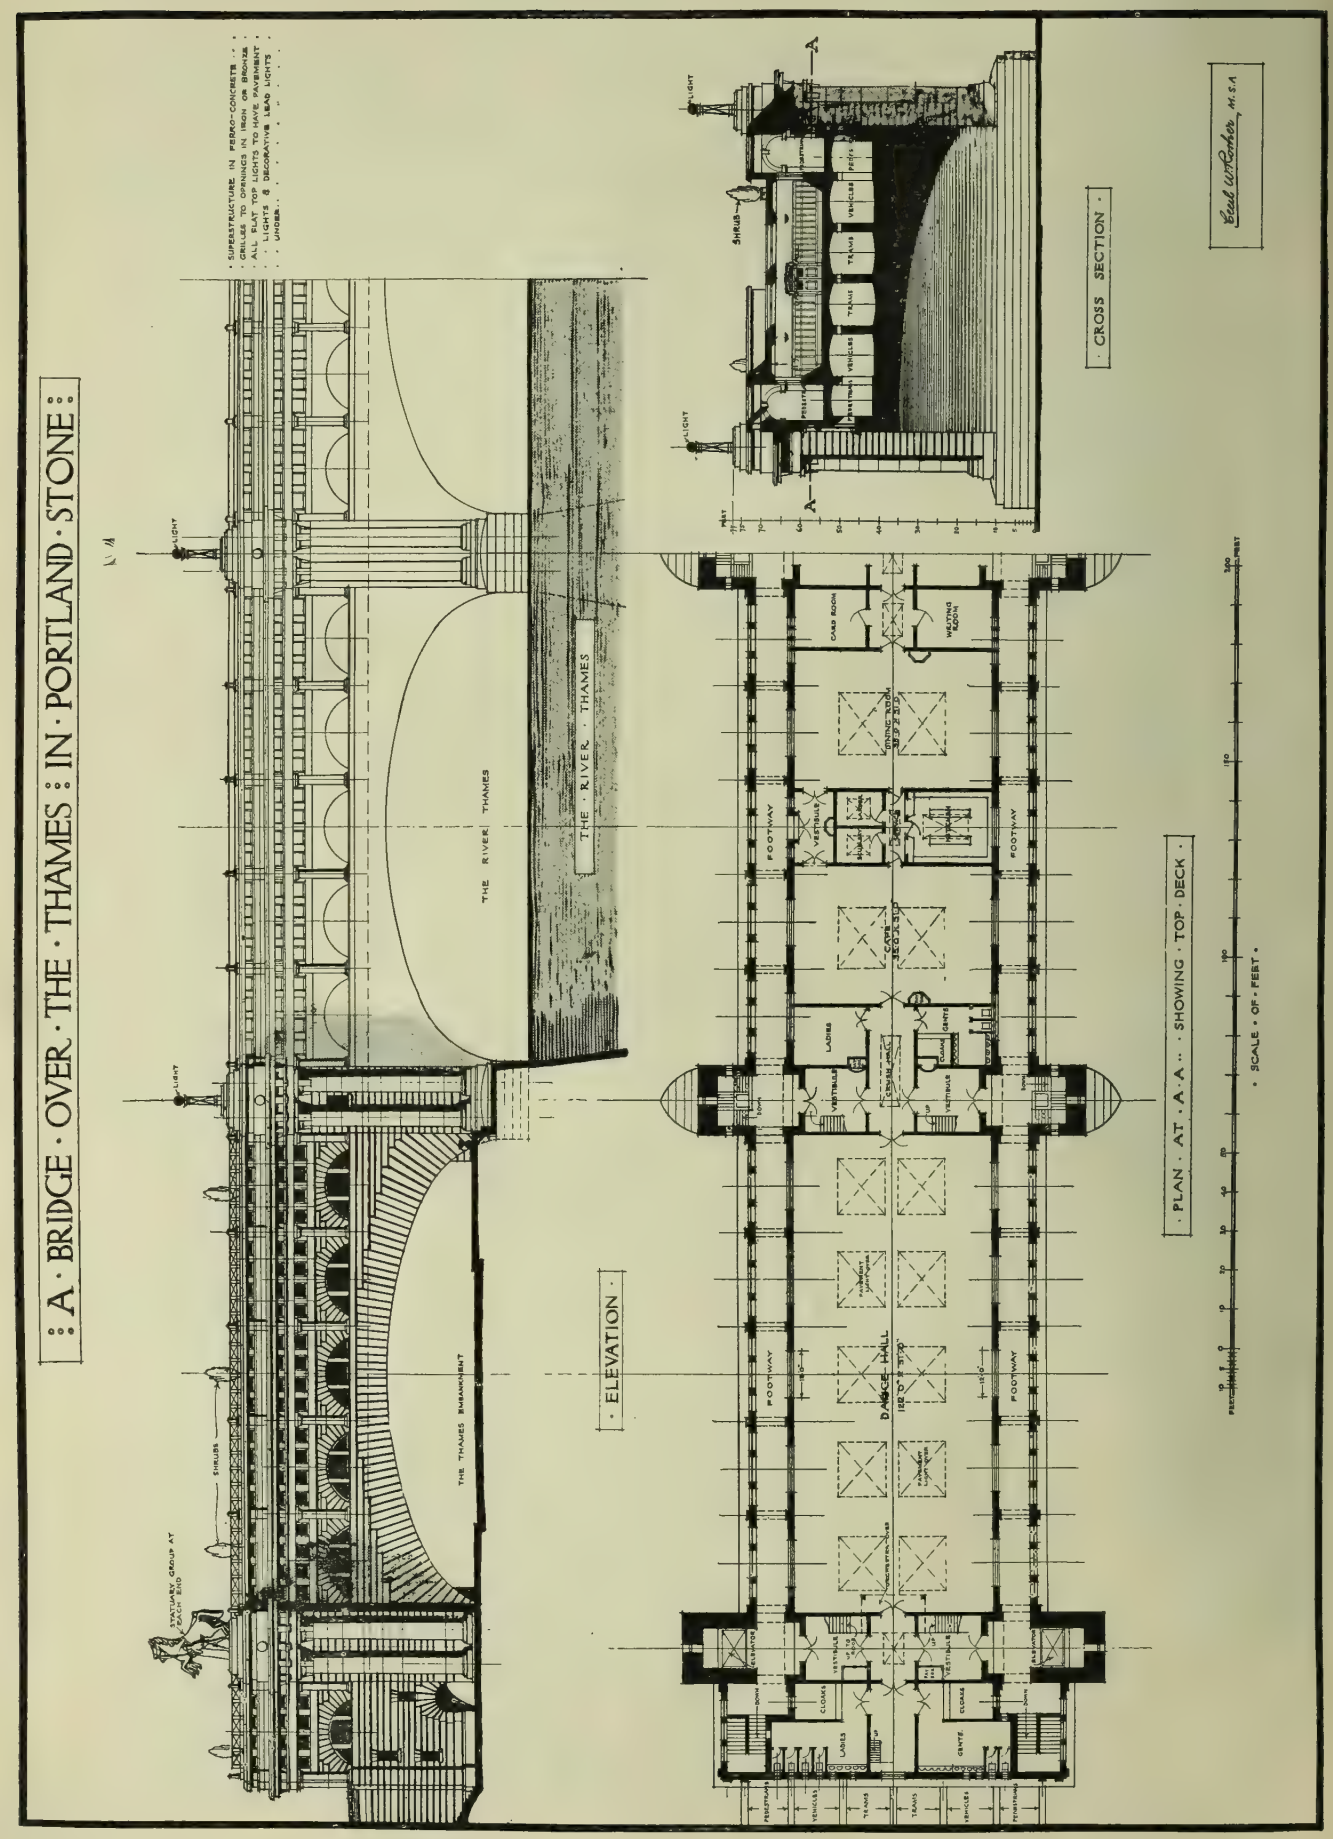
House, Stratford-on-Avon. Mr. L. L. Dussault, F.R.I.B.A., Architect.



Altar in the Basilica, Wembley Empire Exhibition. Mr. W. H. R. Blacking, M.S.A., Architect.

The altar and reredos and the fitments and ornaments in the Basilica at Wembley were all designed by Mr. W. H. R. Blacking, M.S.A., and were carried out by Messrs. J. Wippell & Co., Ltd., of Exeter and London.

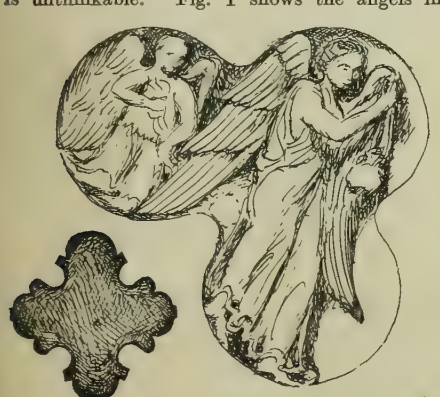
The reredos, of the traditional long, low form calculated to give dignity to the altar, contains a good deal of "Renaissance" detail, although in general design it follows the tradition of English fifteenth century work. The altar-posts, surmounted by tapers, support riddels of rose-coloured material. From the top of the reredos is suspended from a bracket and canopy a hanging pyx. The altar is set out according to the rubrics and traditions of the English Church for the Prayer Book Liturgy. The candlesticks and the large standards before the Holy Table are of wood, gilded.

This building is in the shopping centre of Chester, and comprises a restaurant on the ground floor and the two floors over. The structure is steel-framed, with reinforced concrete floors and faced with heavy half-timber oak-work framed together. The columns supporting the upper part externally are of granite. The roof is of thick green Westmorland slates. The architect is Mr. Henry Hyams, F.R.I.B.A.

Design for a Bridge across the Thames. By Mr. C. W. Rosher, M.S.A.

WESTMINSTER ABBEY RE-EXAMINED—V

By W. R. LETHABY.



CHAPTER HOUSE: SCULPTURE, GLASS AND PAINTING.

The Annunciation Door.—The doorway entering the Chapter House from the vestibule is largely ancient. On the left and right are two very fine sculptures of Gabriel and the Virgin. The arch has a series of small figures in a trellis of foliage. Attachments at the springing and near the crown of the inner order show that there were sub-arches with a circle above. Some years before the great "restoration" was undertaken Scott wrote thus: "The doorway was double, divided by a central pillar, and with a circle in the head; whether pierced or containing sculpture I have been unable to ascertain, as it is almost entirely destroyed. The jambs and arch are magnificent. The former contain on their outer side four large shafts of Purbeck marble. Their caps are of the same material, and most richly carved, and the spaces between the shafts are beautifully carved."

According to Carter's description given before, the doorway showed indications above it of "open tracery (in the manner of the Chapter Houses of Wells and Southwell) cut away." Scott's first design for "restoration," given in *Gleanings*, pierced the tracery, but set an isolated image of the Majesty in the centre of the foiled circle. As this showed the back of the figure to the outside it was doubtless thought awkward, and in the executed work two Christs were substituted, back to back, on a very thin solid filling. I have long been convinced that such a figure or figures would not have been here. The predominating importance of the Annunciation group, the Angel on one side and the Virgin on the other, negatives the existence of another figure, central, but an anti-climax. An open foiled circle would have afforded an entrancing vision of the interior and its glorious windows. Moreover, the vestibule was required to be as light as possible because the windows of St. Faith's Chapel open to it.

On approaching by the flight of steps, the solid circle which now blocks the sight comes almost exactly in the visual line to the foiled circle of the eastern window. The ancient stonework itself in no way suggests a solid circle; what is left gives a tracery-bar profile similar to the general type found in the Church and the Chapter House itself (Fig. 1, B).

Finally and conclusively the large trefoil panels in the spandrels of the arch have minor figures of angels censing the Virgin, who stands in the niche on the right. If there was a central figure these spandrils must be seen in relation to it, and that such figures should be turning their backs on a Majesty, the centre not only of the composition but of the Universe, is unthinkable. Fig. 1 shows the angels in

B FIG. 1.

the trefoil on the right who turn away from the centre towards the Virgin (compare Fig. 2).

The figures of the Virgin and Angel are very noble sculptures, full 6 ft. high. They are so strikingly similar to a pair at the Virgin's door of Amiens Cathedral that it may not be doubted that ours are imitated from the French figures which were more or less copied at Reims also, as indeed was the whole portal. The idea of the design is that the Virgin carries a book of the prophecies, and she lifts her right hand in surprise while the Angel expounds what was written. I have shown that the north transept front, with its sculptured portals, was a modified copy of the west front at Amiens. The resemblance between the sculptures at Westminster and at Amiens suggests that not only the mason at Westminster but the sculptor as well studied French models.

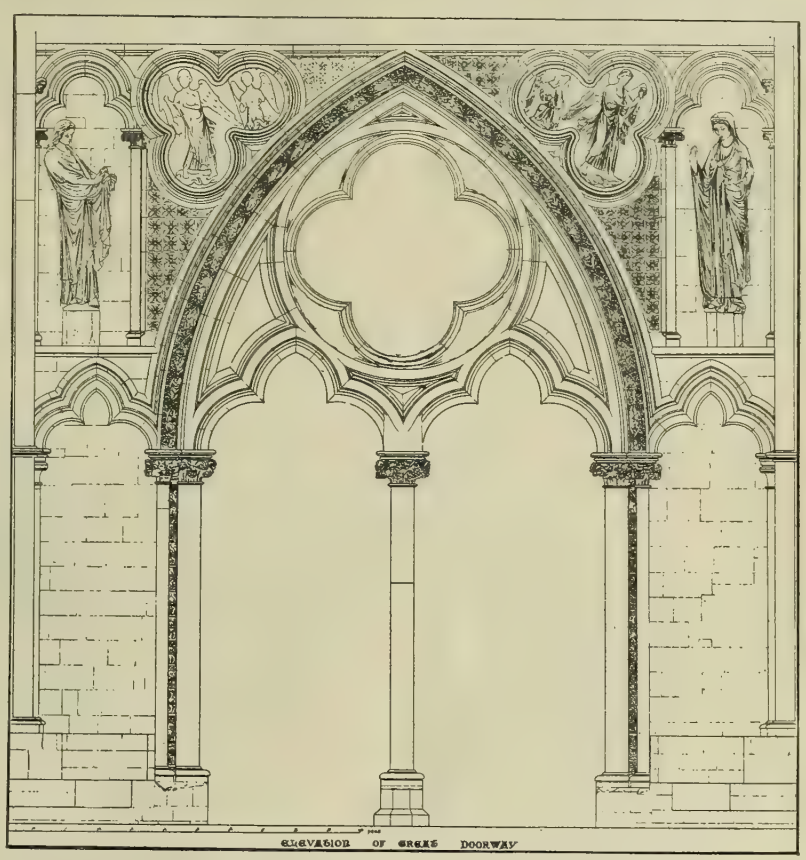


FIG. 2.—Drawing by E. C. SHEARMAN (altered).

The arch-order, which is carved in openwork of foliage containing little figures, is largely old. Many of the figures carry scrolls and they are doubtless prophets. The jambs of this doorway have vertical strips of sculpture between the columns, both inside and out; but the north and south jambs are not similar. The two strips on the north have only foliage, while the two on the south have many little figures set one over the other in scrolls of foliage. At the top of the inner set of figures is Christ. The head is broken away, but the cruciform nimbus remains. The outer set has the Virgin at the summit—a very perfect and remarkable little figure. Over these two figures are pretty canopies, and there are others over the foliage strips of the north jamb, each of which has two birds perched under their shelter—symbols of concord. The little figures of the strips can better be studied from the admirable old casts made about 1860 and now at South Kensington, than at the doorway itself. The foliage, which contains the series which is terminated above by the Virgin, is a rose branch, showing buds and flowers. None of the small figures can be identified, with the exception of one about the middle, which has the horns of Moses. One next below is half clothed and is putting his hose off or on; one near the bottom holds a square block; one near the top is clothed like a friar, or possibly a pilgrim; most are sleeping in a way that recalls the figure of Jesse in "Jesse-trees," to which the design is obviously allied.

The inner strip of the south jamb has, under the Christ figure, others of kings set in scrolls of formal foliage.

Now the arch-orders of the Virgin's Door at Amiens, from which the Annunciation Group was imitated, contains three sets of small images—angels, kings, and patriarchs (?). They are described by Durand as ten angels with censers and candlesticks; twelve kings; fourteen personages in the scrolls of a vine with no identifiable symbols—"evidently the two [last] together represent the genealogical tree of the Virgin Mary, but Jesse is not here." At Amiens and at Westminster, there were more regular trees of Jesse. The exact intention of the sculptor beyond the association of the Virgin and the rose branch is not clear.

The general derivation of these jamb figures from Amiens is, however, certain. Even the crowd of censing angels in the trefoils above the arch seem to follow those of the third arch order at Amiens. If the small figures of the jamb at Westminster are compared with those of the Jesse tree proper at Amiens, illustrated by Viollet le Duc, it will be seen that in each case the figures have little patches of ground under their feet from which the scrolls and foliage spring out; this is so alike in both cases that relation is certain. The small angels in the trefoils just spoken of are rather badly decayed, and from below give little idea of how beautiful they must have been. After close inspection this may just be guessed and good photographs might bring it out.

The sculptures were certainly designed by one who had studied the Virgin's Porch at Amiens. It was specially thought of as the Annunciation Door, and it should be a comfort to us to be able to think away the intruded vain imaginings of the tympanum; the doorway thus becomes a unity—it and the whole Chapter House stands in the "composition" for the House of the Virgin. The doorway at Salisbury has a central

sculpture (originally the Virgin ?) but there were no side sculptures; the whole tympanum is solid, and the sub-arches are not tracery bars.

With the data of the span, the curves at the springing, and the radius of the central circle, we may accept the general lines of the tracery. Possibly Scott found some indication which suggested the central quatrefoil in the circle. The single central column is guaranteed by the

FIG. 3.

tracery section and the size of the jamb columns. The capitals of the jamb columns are in marble elaborately sculptured—one of those on the south side has lions amongst the foliage. This capital is ancient and so, in the main, is its next neighbour. The imitative work is so clever or specious that it is difficult to be sure of anything without testimony, but the northern capitals may be copies of broken ones. I have a letter from Mr. C. Burgess (1909), who worked on "the restoration," in which he says "the capital with the lions is old; most of the others in arcade are modern, also the heads." There is a cast of the lion capital at South Kensington (Fig. 3).

This noble doorway is one of the most beautiful things in English art.

Jesse-tree Doorway.—The outer entrance from the cloister must have been equally beautiful, but it is now terribly decayed. "Over the entrance into the Chapter House was placed the statue of the blessed Virgin with our Saviour in her arms, and two Angels, one on each side, all richly enamelled and set forth with gold and blue, some vestigia or footsteps of all which are still remaining whereby to judge the former splendour and beauty thereof" (Keepe, 1683). When Keepe wrote there was probably actual memory of the central figure. The two angels are ruins of most beautiful figures, apparently by the sculptor of the Annunciation. The field of the tympanum is covered with strong scrolls of formal foliage, now so much decayed that only the "shadows" of them may be seen. Old sketches, however, and the careful measured drawing by Mr. Knight at the Victoria and Albert Museum, have preserved some record. A sketch made by Poynter about 1820 of part of the scrolls on the arch-space shows that they had doubled stems; this is a point in development which is confirmed by Knight's drawing. An accurate looking woodcut of this foliage in *Gleanings* is without much value, as it was done from a poor sketch now at Westminster.

Knight's drawing just mentioned shows some jointing in the form of a little gable over the central plain space against which the image of the Virgin was placed, and it is evident that there was a canopy here. This is confirmed by the existence of two minor corbels attached to the base on which the statue stood, for these must have supported small shafts under the canopy (Fig. 4). The figure of the Virgin, we may suppose, was like that of the Virgin's door at Amiens. The attitude of the angels on either hand suggests to me that they may have carried candlesticks; the angels surrounding the Virgin at Amiens bear candlesticks and censers. One of the angel images is much injured; the other is a very beautiful headless figure (Fig. 5). There is no doubt as to the doorway having been painted brilliantly and gilt. In the Victoria and Albert Museum, Burges Collection, is a drawing which carefully recorded traces actually existing sixty or seventy years ago. The field of the tympanum was blue with gilt foliage, the hollows reinforced with vermilion. This explains the rather timid colouring on Carter's original drawing in the Gardner Collection. The ground is tinted blue, there is red here and there in hollows, and some of the carving is yellow for gilding.

One of the arch orders is carved with the "Stem of Jesse," and this was certainly copied from the central portal at Amiens (see Viollet le Duc and Durand). There Jesse appeared twice over, being the bottom figure on each side, while the stem terminated at the apex in figures of the Virgin and Christ. According to the text with Carter's excellent plate of our doorway, "the three lowest figures are precisely the same on both sides of the arch. . . . It is probable it was intended that one side should represent the Kings of Israel and the other those of Judah, both having had in common for ancestors Jesse, David and Solomon." It is said that in the centre of the top is the figure of the Virgin and Child, but this, I suppose, meant the central sculpture. The foliage on the tympanum was considered to be part of the Jesse-tree. Fig. 6 is from a sketch of the arch made about 1910.

Enlarged sketches of the figures by Carter show that most of the figures had crowns and the second figure on each side had a harp—that on the left may still be seen. Carter's plate shows also the round, nest-like units of foliage which decorated the other arch order. The central part of each boss which was undercut has now disappeared. Many years ago I made a sketch, which is enough to show that it was almost identical with carving around the blank

FIG. 4.

Fig. 5.

tracery at the end of the inner vestibule. Old descriptions gave details of the colouring and gilding of the Jesse arch. If I were younger I would compile a restored drawing of this wonderful doorway, one of the most romantic things in English art. I wish we could interest ourselves in such drawings instead of destroying authentic antiquities and calling that restoration. The vault of the northern alley of the outer vestibule is a restoration, the southern alley, with its fine bosses, is original.

Fig. 6.

The work in the inner vestibule is largely authentic. The most doubtful major feature is the three-light window on the south side. Scott spoke of this as "a remarkable window now destroyed, but of which, by cutting into the walls, I have been able to gain some clue to the design." In his illustration he shows a high central portion flanked by two lower lights which have curious long trefoils in the spandrils above. The window as restored is like this except that the high central portion is of one light instead of two, as in the illustration. Mr. S. Weatherley told me that sufficient indications were found when the work was done to make the form certain. Indeed, it is clear that there is not room for four lights. The upper cusps

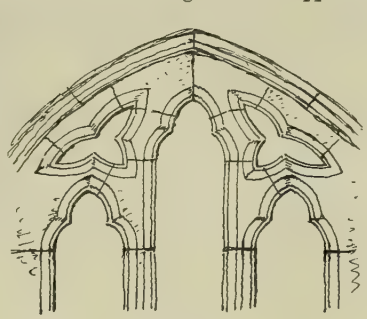

Fig. 7.

of the long trefoils are still old within, and the window may be accepted as of ancient form. The idea of the trefoils was probably taken from those over the Annunciation door which were borrowed from those over the West Rose at Amiens. Fig. 7 is from the exterior of this window. Fig. 8 is the end of the inner vestibule mentioned above.

Glass and Painting.—We have seen that Burges recommended grisaille glazing, but his advice was not followed. Since that time, remnants of such glass have been found in the apsidal chapels of the Church. The companion or daughter Chapter House at Salisbury had grisaille windows with a bright shield of arms set in each light. That this was the arrangement, too, at Westminster, is further proved by what Sandford says of heraldic shields:—The arms of Henry III and Eleanor of Provence "are yet standing in several windows in the Abbey—the arms of Raymund, Earl of Provence, are painted in the Chapter House windows and several other windows; the arms of Eleanor of Castile are in a glass window on the west side of the north cross." Three or four of these shields of arms still exist in the glazing of the apse windows. It is evident that the Chapter House of Westminster had similar glazing to that at Salisbury, and like that it must have been a vast vessel of light. At present the windows are filled with deep-dyed tints and the electric light has been brought in. At Salisbury Chapter House the centres of the large roses had pairs of figures, a King and an ecclesiastic, set on a grisaille ground. This, too, was probably taken over from Westminster.

The panels of the wall arcade contain paintings of "The Doom" and "The Apocalypse." These are of the fourteenth century, and I gave some description of them in the *Spectator*, July 7, 1923. The arches and diaper work above the eastern bays only, show traces of colour and gilding, which may be of the original work. In Piers Plowman's "Crede" is a

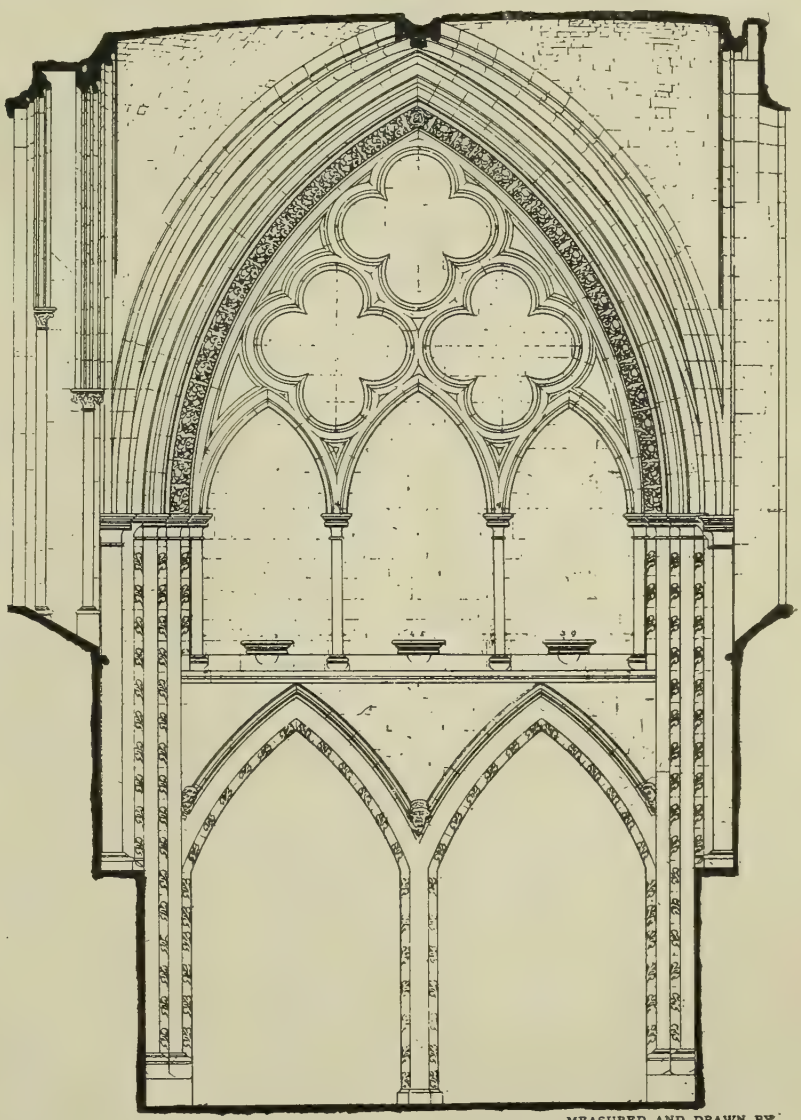

Fig. 8.—Measured and Drawn by E. C. Shearman.

passage describing one of the great Friaries of London as having a Chapter House "painted all round like a Parliament house," and this allusion may have been suggested by the recent decorations of what is known to have been the meeting place of Parliaments at Westminster. The large provision of stone seats around the Great Octagon suggests that Henry III had from the first intended to use it for such assemblies.

Crypt.—Under the Chapter House is a crypt, which is well described in *Gleanings*. It is very strong and was doubtless intended for a Treasury. The walls are nearly 18 ft. thick; three doors intervened between it and the south transept, the stone stair stops about 4 ft. from the bottom and is continued by a short detachable wooden stair which looks like a thief trap. In the central pillar of the crypt are some cavities closed by thin stones.

It has been argued recently that this was the King's Treasury robbed in 1303—the most famous burglary in English history. The chief evidence is that the place robbed is said to have been "under the Chapter House." That seems conclusive, until we remember that "under" was often used in the sense of inferior and near, as under-hill, under-shaft. In the account of the affair given in *Gleanings* are two quotations from documents, one of which is translated, "The treasury near the Chapter House," and the other "below." Another Abbey treasury, the chapel of the Pyx, is under the Chapter House in the second sense. I should not enter on this much disputed subject were it not that I may put on record some evidence from the structure which may be helpful.

I doubt whether the Crypt actually beneath the Chapter House was at an early time in regular use; for long it must have remained very damp. In 1909 it was cleaned out and then nothing more than a mortar floor was found. Scott says that earlier it had been "filled up some feet above its natural level with earth," and that he "lowered it to the original level." Such raising of the level with earth suggests flooding.

Mr. Hall, in "Antiquities of the Exchequer," says that the King's great Treasury was the Chapel of the Pyx. "Here the King's four crowns and the other regalia were deposited with many jewels as late as the reign of Henry VI." He objects to the view that "the treasure of the Wardrobe was normally situated below the Chapter House," but he adds, "it was there undoubtedly in the nineteenth year and later" (1291, &c., *cf Archæologia*, xliv). There is a record that the Treasury "under the Chapter House" had a new floor of tiles laid in 1291. This entry is discussed by Mr. Clayton, in the *Archæological Journal* (1912), and he concluded that it probably refers to the Chapel of the Pyx, where a tile floor of about that date still exists. Again the violated Treasury is said to have been under "the Monks' Chapel," which those who accept the crypt solution think may be another name for Chapter House, whereas the Monks' Chapel may have been St. Dunstan's, close by on the other side of the Pyx.

The vault or walls of the crypt have never been broken through, and Mr. Westlake suggests that the thief "cut through the iron bars" of one of the crypt windows. The evidence, however, seems to point to a hole in a wall.

The burglary was effected from the Cemetery between the Dormitory range and the palace. The chief thief was Richard de Podelicote, who was assisted by John, a mason, who made the "engines" or implements of iron used in making a breach in the wall. Podelicote worked at it for months before he obtained entry. Professor Tout reproduced a rough contemporary sketch of the thief at work, and it has been suggested that windows appear here. I only see an indication of a vaulted structure.

At the inquiry it was asserted that four years previously an attempt had been made to break into the same treasury from the cloister side. It is evident that this piece of evidence is strongly in favour of the Pyx site, although it has been said that it "need not necessarily do so, for it would be possible to attack the undercroft of the Chapter House from the Cloister side." I cannot see how, and in any case no window was accessible from this side. Again, Mr. F. Bond thought that the Poets' Corner door was an insertion made in order to give access from the palace to the crypt, since it cuts into the arcading on the left. The doorway seems to me to have been foreseen and built in with the work. Leaving the difficulties involved in the Crypt hypothesis, I wish to point out that there is some material evidence which suggests that the external wall of the Chapel of the Pyx against the Cemetery was at some time broken through. Directly inside the thirteenth-century north door, which Scott believed to be the original entrance to "the Pyx," is a patch of repaired walling low down, which looks, as was pointed out to me by Mr. Wright, as if it might have been the actual point where the thief entered. Outside is a blind corner sheltered by a Chapter House buttress so completely that it is easy to think that a man might long have worked here hidden. The north doorway just mentioned is that which has fragments of some skin (said to be human) which lined it within. The existing doorway into the Pyx from the Cloister is later than 1303; possibly this door was formed and the old one walled off from the Pyx (as at present) in consequence of the robbery, as is suggested in *Gleanings*.

Exterior.—The outside of the Chapter House has been almost entirely renewed. In the junction with old work near Poets' Corner we see that the new masonry takes up with the old courses. Here and there on the sides towards the south Scott left patches of the old face; he speaks, indeed, of having found a portion, which had been sheltered, as being so fresh that there were masons' marks on the stones. This is a point not otherwise known. In one bay stones of most of the courses show (September, 1923) 5 to 9 inches high—notice how narrow, and this was characteristic of the exterior masonry generally. It is curious that the walling was different in each bay, the number of courses between plinth and window cill varying from about sixteen to twenty-two. Scott followed the old coursing throughout; he also probably had authority for making the buttress slopes in continuous planes. The drip at the bottom (one ancient fragment inserted) is of the typical French section. The plinth is also a French profile.

Old sketches show that the lines of the main subdivisions of the windows appeared here and there on the exterior parts. Of the flying buttresses, additional works of the fourteenth century, stones remain here and there. There is a record that in 1377 some boatloads of stone were employed on the "pinnacles of the Chapter House" (Rackham); probably this gives the actual date of the erection of new buttresses. The one next to Poets' Corner seems to have been first built with the "restoration"; it does not appear on the plan in *Gleanings*.

The Mason.—The entrance to the Chapter House, if not the whole of this work, as I now think probable, was executed by Master Alberic working by sub-contract. The accounts show that much masonry work was done by "task," and this was doubtless a means of pressing it forward to meet the desires of the impatient King. In a fabric roll of 1248–9 at the Record Office, Master Alberic appears as receiving the then large sum of £45 for "task work" on the Cloister. As I observed before, "it is evident from the large sum (worth, say, £1,000) that he must have had several assistants, and that he was carrying out a contract for the workmanship of those bays of the Cloister which belong to the first work"—and, I would add, lead from the Church to the Chapter House.

I also pointed out that Master Alberic was mentioned three times on the "Long Roll" of 1253 (published in *Gleanings*). "It is noted on the back of the Roll that at a certain time he had begun three windows by task." (The note says "with three companions," so it is clear he was working with his staff.) In the shorter Roll of this year (K.R. 466, 30), entitled: "Account of divers works at the Church, Chapter House, Belfry and Palace," Alberic's name also occurs, and "he is there said to have been engaged on the entrance to the Chapter House. It seems that we may definitely assign the bays of the Cloister leading to the Chapter House and the entrance of the latter to Master Alberic. We have seen that the system of task work was largely made use of, and Master Alberic seems to have been engaged in the execution of such work from the beginning."

The three windows mentioned above I thought might refer to the traceried bays of the early part of the Cloister, but on the whole this is unlikely. The windows may have been in the Chapter House or in the entry. The traceried openings of this part of the Cloister are now only copied work, but old drawings by Carter show that they are accurate copies. The original work even had the curious pebble-like lumps filling up narrow gaps in the tracery. Of the capitals I am less sure, but there is a sketch of one like the new ones at South Kensington which was made by Collings in 1842 (E. 4086). It is certain that Master Alberic was engaged for many years and probably from the beginning of the works. I am drawn to think that he, with his own men, probably executed the Chapter House entirely under the general direction of the Chief Master. The windows and the wall arcade were designed by a master who had studied French works, but there seems to be a distinct difference of feeling between the details of the church and the Chapter House with the bays of the cloister leading to it. This confirms the evidence of the documents.

I have no note of the sum, if any, mentioned on the Short Roll as paid to Alberic, but in the Long Roll of the same year appears: "for task at the entrance to Chapter House 50s." Such a small sum (say £50) could only have paid for small finishing work, but as the year was 1253 when the windows were already erected (see below), that is what we might expect, and finishing off would be done by the original artist.

In the Long Roll of 1253 is noted that Master Alberic was paid for 1,280 feet of "voussoirs with fillets at 3d. a foot," for "50 assises" (facing blocks) at 5d. each, and for "seven steps cut by task work." The seven steps may be those in the Chapter House vestibule.

The title given above of the Short Roll implies that the Chapter House was to some extent regarded as a separate work. This Roll includes an item for canvas used in closing the window, of the Chapter House; a second payment was of 53s. 4d. for two images made by task works which Professor Prior has suggested may be the lovely Annunciation group itself.

Saddleworth War Memorial on "Pots and Pans" Hill.

Mr. G. B. Howcroft, A.R.I.B.A., Architect.

THE TOWN-PLANNING INSTITUTE

Mr. T. H. Mawson (President) took the chair at the annual meeting of the Institute, held on June 20, at 92, Victoria-street.

The following were elected on the Council for the ensuing year:—Members: P. Abercrombie, S. D. Adshead, Thomas Adams, W. R. Davidge, F. M. Elgood, W. T. Lancashire, H. V. Lanchester, T. A. Lloyd, T. H. Mawson, B. Parker, G. L. Pepler, H. E. Stilgoe, F. L. Thompson, R. Unwin. Legal Members: E. R. Abbott, R. A. Reay-Nadin. Associate Members: F. W. Platt, J. A. Webb, E. Willis. Legal Associate Member: C. P. Lovelock.

It was decided to increase the subscription by £1 1s. per annum.

The Model Clauses: Convenience and Amenity.

Mr. Reginald Bruce, A.R.I.B.A., contributed a paper on the above subject in which he said that, in approaching the subject of convenience and amenity, one was confronted with a great variety of matters, all of which, to a greater or less degree, affected the comfort and happiness of the people, and the well-being of a town. Some were perhaps of such a contentious nature that they had so far been intentionally omitted. Others, perhaps less important, might be considered as minor details, but as "trifles make up the sum of life" so he ventured to say that these comparatively small matters had a very considerable bearing upon amenity and convenience. The furnishing of towns might be mentioned, but this together with other similar matters the local authorities were themselves responsible for. The author suggested that steps might be taken to improve the name-plates of streets, and he asked why electric light and tramway standards should be placed in the centre of roads. Then he asked why should every open space be surrounded by a hideous iron fence, and why it was that squares in towns were so often spoiled by the intrusion of public conveniences. Dealing with the clauses regarding "Safety of Traffic," he said it was most essential that the question of line of vision should be carefully dealt with. The clause regarding the preservation of trees was a wise provision, and it would be interesting to learn why it had been omitted from so many schemes. The question of advertisements had already been dealt with by the Advertisement Regulation Act, 1907, and the Ancient Buildings Amendment Act of 1913.

The clause in the Models certainly did not seem to carry the matter much farther, but did it not leave too many loop-holes by which people might escape from the real objects aimed at, and would it not be better to make more definite regulations controlling the size of any advertisement height above ground, size of lettering, and so forth? Also would it not be well to insist upon every person proposing to fix advertisements, subject to certain exceptions, of course, obtaining the consent of the local authority? As the clause read at present, it would appear that anyone could fix an advertisement, and then it would have to be proved that it was detrimental to the amenities of the district. The clauses dealing with the maintenance of private gardens were very desirable, but why were not allotments included? Some restrictions should be placed also on vacant land, derelict property, and other untidy yards and places which were detrimental to the amenities.

The Model clauses had unquestionably been admirably prepared, and referred to most matters with regard to which control was desirable. There was, however, one important omission concerning a matter the consideration of which had perhaps been delayed a little too long, and that was the character of buildings and the control of design. This was, undoubtedly, a very contentious subject and therefore the greater reason why it should be fully discussed.

It was generally agreed that a sense of beauty was inherent in most people, and if the inhabitants of a town could be imbued with a feeling of civic pride and be brought to realise that the local authority was really endeavouring by means of town planning to secure amenities for the benefit of the community as a whole, streets which it would be a pleasure to walk in, buildings which were objects of beauty, gardens and open spaces to rest in, he was sure that any restrictions which were made would not be difficult to carry out. He believed, too, that architects, builders and all concerned in the development of towns would readily co-operate with the local authority to secure what was desired. To secure control with respect to the character of buildings and nature of building materials was, perhaps, not easy; but might not the same have been said with regard to all aspects of town planning, yet the Acts were passed and further legislation would be carried through. Concerning this particular aspect it might be said that too much rigidity might be fatal to the desired effect; what was required was elasticity without looseness, and control without officialism.

Character of buildings did not appear to have been generally dealt with in schemes so far approved, and Ruislip-Northwood stood almost alone in having inserted a clause dealing with the matter.

The clause reads: "If, having regard to the nature and situation of the site of any building or buildings proposed to be erected or altered, or to the character of any buildings erected or in course of erection in the neighbourhood of such site, the Council is of opinion that the character of the building or buildings proposed to be erected or altered would be injurious to the amenity of the neighbourhood, whether on account of the design or the undue repetition of the design or the materials to be used, the Council may require such reasonable alterations to be made in regard to the design or materials as they may think fit, and may require the plans to be amended accordingly." Provision was also made for any case of dispute, when the President of the Royal Institute of British Architects would be asked to appoint an arbitrator whose decision would be final and conclusive.

The question of who was to decide the many matters which would arise was a very vital one; the arrangement in case of dispute just referred to might work very well for a district like Ruislip-Northwood, but it is open to doubt whether it would be equally satisfactory in a large and more highly developed town.

A number of suggestions could probably be put forward; one was that an Advisory Art Committee—or perhaps some more appropriate term could be applied—should be set up for each town, or possibly a district, to which would be submitted for consideration and recommendation matters relating to proposed buildings or alterations, open spaces, town furniture, and any other matters which might be considered as affecting amenity. Such a committee could be constituted on somewhat similar lines to, say, the one existing in Birmingham, and would provide for representation by the local authority, certain local societies and schools, and some persons with special technical knowledge. In addition, there should be an expert town planner with no local interests—such expert, he suggested, would not be a member of the committee, but would be retained to be called in from time to time as circumstances required, and, if necessary, to submit detail schemes for any particular parts of the district.

It might be contended that local authorities were the elected representatives of the people and therefore had the sole right of deciding all matters brought before them, but, generally speaking, he thought that members of local authorities would admit that they were not qualified to deal with matters relating to the architectural treatment of building, civic designs, and art matters generally. The officials, too, working under a town-planning scheme, which controlled design and relative matters, would welcome the formation of some impartial body to which such matters could be referred.

Mr. Goodrich (United States) said he thought there were more favourable opportunities for working out town planning in England than in America. The paper was of great interest to Americans, but he thought under the zoning regulations in force in the States there was power to do many of the things the author had suggested.

Mr. T. Adams, in moving a vote of thanks to the author, said he had every sympathy with his points of view, but doubted the practicability of putting into effect his suggestions regarding the characters of buildings. When the Ruislip-Northwood clause was under discussion, the point was raised whether it was possible to arbitrate on a matter of taste, and, knowing the differences of opinion which existed among eminent architects, made him think the introduction of such a clause would meet the difficulties. He would rather that every town had a consulting architect to advise it on such matters, but he doubted if architects would agree to that.

Mr. E. Willis remarked that architects could help them greatly in the matter of proper angles of vision at junctions of roads by making a big set back in the ground floor of their buildings. He thought they required more legislation with regard to advertisements, for the electric signs in the main streets of London were a blot to the eye-view.

Sir R. Paget agreed that legislation in regard to advertisements was required. Every advertisement ought to prove its truth and its beauty. Traffic crossings were becoming matters of fundamental importance, and local authorities should have further powers to deal with the matter. They had railway stations, and yet the public, through lack of vision, was content to stand in the rain whilst waiting for omnibuses and tramcars.

Mr. L. M. Jopling thought it dangerous to associate town planning with art. The right way in which to approach the public with regard to town planning was to show that it was based on economic principles. The only way to get better advertisements was to improve the public taste.

Mr. L. Rosevear pointed out the difficulties which Eastbourne had experienced in regard to finding sites for public conveniences. He also referred to the hideous effect of allowing all sorts of shacks on allotments.

Mr. E. R. Abbott said at Ruislip they absolutely prohibited any building on allotments. The local authority provided a shed for the holders, and this was the only way to deal with the matter. Clauses about the character of buildings were useless, unless the local by-laws conformed with them, and he felt that the Ministry of Health must make up its mind whether it would continue to allow many of the buildings which had been erected, or insist on proper building.

Major Lovelock remarked that at Carshalton they had taken a lot of trouble to preserve trees, and now an expert told them that on account of age most of the trees must come down.

The President said it was foolish to plan a road with trees which would only last 20 years. It was advisable to call in an expert forester first.

Builders' Excursion.

Messrs. Howard & Co., builders and contractors, of 3, Broad-court-chambers, Bow-street, W.C.2, recently held their annual outing. The day was spent at Clacton-on-Sea. The chairmanship was in the hands of Mr. G. R. Perkin, manager to the firm.

THE BRITISH SOCIETY OF MASTER GLASS PAINTERS

THE annual general meeting of the British Society of Master Glass Painters was held recently at 6, Queen's-square, presided over by the Earl of Crawford. To add interest to the occasion a very various and representative collection of photographs of mediæval glass was shown at the meeting, largely due to the initiative of its Secretary, Mr. Noel Heaton, whose researches on the technical side of glass are well known. This Society, which has now become well established, has for its objects: (1) To promote whatever may tend to elevate the art of glass painting and staining; (2) to take all necessary steps for the preservation of the ancient glass of this country; (3) to formulate the usages and customs of the craft, &c., and generally to draw together the interests of craftsmen and promote their union together. The first object will appear at once the most hard and difficult of attainment, and reminds one of that reply of Goethe's to the young man who desired to improve the world, that he would find it a proud and difficult task. At the same time, there is evidence of an improvement in craftsmanship of a kind—if that were enough—even if we are compelled to miss the evidence of a more deeply-felt impulse. It may be that until a wider scope in subject matter establishes itself and many of the hereditary respectabilities of "ecclesiastical" art are replaced by more vital constituents, and by a greater conviction in the artist himself, it will present itself mostly as a survival because it does not embody enough of present life and experience. And it would seem that this no society can secure for us. It is the individual who stands above organisation in whose prerogatives lie more first-hand direction, to whom we must look for improvement, and perhaps it requires even from him a new conversion to replace old worlds with new. Art is such a personal thing, emerging so unexpectedly, and so often away from all the machinery intended to promote it, that we have to be careful lest in promoting the one we lose sight of the other. It is natural by association to seek strength for a cause in order to make ourselves and our aims more felt. But the danger of all such organisation which is now better discerned whether we call it "registration," "promoting high standards," or "encouragement of art," is that it does not secure the aid. The strength of the average presses hardly on the individual, and the best is at a discount with the good, which becomes its enemy. Nor is this the result of "mere cussedness," but arises from its own nature, which is to promote what it knows, and the best is unknown, because it is revelation. If this seems too hard a saying, it is the witness of not a few who have watched the enormous development of societies in recent years, and the effect of such organisation over the last years.

This is said without intention to deprecate the usefulness of such a society within its own limits; sincerely directed as we believe it to be towards the improvement of the art of stained glass. What must always remain more important is art itself, which organisation cannot endorse.

Associations—organisation of whatever kind—to "elevate" art will never supply what the properly-directed virtues of a people can only supply for themselves, and though the former may play their part in minor ways, the future will unfold to us more and more a choice less directed by machinery, because the fulfilment of a proper citizenship requires that we should ourselves distinguish and recognise the good when we see it.

If we miss in such a society the means for effecting such improvements as the elevation of the art of glass painting, it is because that task can only be sustained by the artist himself, and craftsmanship is not enough. The source of service through a society such as the British Society of Master Glass Painters appears rather to lie in its contribution to the scientific side of the craft of stained glass, and its watchfulness for the preservation of ancient glass. On this side the society has an advantage in its able Secretary, Mr. Noel Heaton, whose labours have so long been directed with much success to investigation on this side. There is much useful work to be done in these directions which does not give challenge to the views we have expressed. We must look to the artist for the source of art and no organisation can hope to take that place, or intervene between him and his more direct relation. Organisation is not authority, though often mistaken for it, and it is where it claims to decide for us or intervenes to impose its own standards that the freedom of the arts no less than the ideal of democracy itself is seen to become threatened.

BOOK REVIEW

The A.B.C. of Nineteenth-Century English Ceramic Art. By J. F. BLACKER. (Stanley Paul & Co., Ltd.) Price 15s. net.

Let us say at once that the "A.B.C." part of the title is quite harmless. There is nothing alphabetical between the two covers apart from the index which is quite excellent and exhaustive. The "A.B.C." merely brings it into line with some half-dozen books by the same author. On its first appearance in 1911 the book was published under the shorter title of "Nineteenth-Century English Ceramic Art," and it may now be regarded as a text-book. In writing the histories of the still extant nineteenth-century factories, many of them of earlier foundation, such as Wedgwood and Worcester, the author has gone to the fountain heads for data, and has gleaned information which will be new to many readers. A brave attempt is even made to clear up the age of Wedgwood's specimens where the mere mark is but an unsure guide. We will forestall the collector—may we say the "average" collector?—who says, "I want nothing to do with the nineteenth century." Let him remember that Walton, who commenced making his now much-prized figures in 1790, was still modelling in 1839 and, but for the "relentless hand," might well have lived to exhibit his latest productions in the 1851 Exhibition. Nineteenth-century ceramic art has begun to "sing," from the collector's point of view, to some considerable "tune" before the twentieth century has run its first quarter. Is a piece of pottery or porcelain "antique" or desirable if made in 1799, or "modern" and worthless when dating from 1801? Who but the collector with horse-sense would have predicted to-day's high prices, for example, of the productions of the brothers Martin or William De Morgan? The Martins were not well able to work much before 1875, and we have before us a Sotheby catalogue of November, 1919, showing a collection of fourteen signed pieces—jugs, bottles, vases—ranging from £7 to £20, and a pottery clockcase fetching £48 under the hammer. What these specimens were priced at at the Southall kilns we leave to the estimates of those collectors who had the good fortune to know the four brothers more intimately. The Martins were artists to their finger-tips, never out to make money. Their secrets died piecemeal as each brother passed away—the last not more than a year ago—but the truth remains that whatever these men touched with the "potter's thumb" will live. He who thinks he would not care to possess (or, perhaps, knows nothing of) a William De Morgan dish with its wondrous pulsating lustre which vies with that adorning the Hispano-Moresco chargers, or a jug or bottle in the style and feeling of old Rhodes or Damascus, let him straight away examine the "recent acquisitions" at the South Kensington or the London Museums. Examine in detail George Tinworth's masterpiece in plastic art in Truro Cathedral—"Going to Calvary"—and he will find something in contemporary art in the spirit of the fifteenth century. The story of Tinworth's early struggles and final emergence from an apprenticeship to a wheelwright's shop is a romance scarcely surpassed by that of Bernard Palissy. The mass productions of the English factories of the last century give pride of place to nothing on the Continent or elsewhere. Our potters, perhaps beyond all other artificers, have proved that use and beauty can walk hand in hand. The mass production is for the masses; but the things that tell for the elect are those which bear the individual impress of the artist. Mr. Blacker is an industrious writer who helps us to a better knowledge of things worth knowing in nineteenth-century ceramic art. The 526 pages of letterpress interspersed with 1,200 illustrations of wares and pottery marks will be a boon to the collector who grasps the fact that the comparatively new wares of the recent yesterday will be the antiques of to-morrow. The potter's art did not die in this country when the Bow and Chelsea factories closed down any more than it did in China when the Emperor Kien Lung was gathered to his fathers in 1795. The book is a useful addition to the working library of the dealer in antiques and, having read it, the collector need never again be fobbed off with the Stafford shire plate or jug of 1850 which "has been in the family for 150 years."

The Studio Year. (London: Offices of *The Studio*, Ltd.) Price 7s. 6d. net.

The "*Studio* Year Book of Decorative Art" contains a review and record of the latest development of architectural design decoration and the furnishings of the house and lay-out of the gardens, both here and on the Continent. Many good examples of English domestic work are illustrated, and much ingenuity and skill in the planning of both house and garden is displayed. Attractive coloured plates are given. The furniture and pottery section are also well represented, and from the contents of the number a good idea may be formed of the trend of modern art of to-day.

THE ROYAL SANITARY INSTITUTE

THE congress of the Royal Sanitary Institute which is to be held in Liverpool shortly will concentrate a large amount of expert attention on many problems and proposals relating to public health.

The eleven sections and conferences included in the arrangement of the meeting will be presided over by the following well-known authorities: The Right Hon. the Lord Mayor of Liverpool; Lieut.-General Sir William Leishman, Director-General, Army Medical Department; Dr. T. M. Legge, Senior Medical Inspector of Factories; Dr. E. W. Hope, Medical Officer of Health, Liverpool; Mr. John A. Brodie, City Engineer, Liverpool; Dr. T. W. Naylor Barlow, President of the Society of Medical Officers of Health; Alderman Moyles, J.P., Chairman, Liverpool Port Sanitary Authority; and Mr. E. G. Mawbey, City Engineer, Leicester.

An attendance of over 1,000 is expected, being largely officers and representatives of Government departments, municipal and public health authorities in the United Kingdom, but including also many representatives of Foreign Governments, Dominions and Colonies of the Empire.

The opening address will be given by the President, the Most Hon. the Marquess of Salisbury, and the popular lecture by Professor H. R. Kenwood, of the University of London, who will deal with modern civilisation from the health standpoint.

The subjects covered by the papers to be discussed indicate the controlling influence that hygiene has in all periods and conditions of life. Attention will be given to maternity and child welfare, public health education, and the value of voluntary public health work. The question of housing will be dealt with from several points of view. As a demonstration of many of the subjects, a large health exhibition is held in connection with the meeting.

ARCHITECTS' AND BUILDERS' INQUIRY BUREAU

*** We are glad to give questions and answers but cannot accept responsibility for contributed replies, especially on legal matters.*

Claims Against Bankrupt Contractors.

SIR,—Your article in the Enquiry Bureau column about claims and bankrupt contractors is rather interesting to us. Would you give us some information on the following case ?

A contractor who had all his goods from us in the shape of hoists and winches got a mortgage from the bank which covered all plants. This builder eventually was foreclosed by the bank, and we are informed that there are no assets available for any creditors. This would appear to us to be a case of bad justice, and we are informed that the continuation of the building is being carried on by another contractor.

In your opinion, is there any redress for us ?

"R. W."

[In answer to "R. W." particulars as to the nature of the mortgage might have been given with advantage, since it is important to first determine whether it is one coming within the Bills of Sale Acts, 1878, 1882 and requires to be registered.

If the land on which the building work was being carried on is mortgaged to the bank, the mortgagor's right to enter upon and take possession of the premises does not require to be registered as a bill of sale; but where the mortgage confers on the mortgagee, as against the mortgagor a power to sell unfixed materials and plant independent of the power to enter upon and take possession of the premises, which can be exercised without the latter power being exercised, then the mortgage does require to be registered as a bill of sale. See Climpson *v.* Coles (1889) 23 Q.B.D. 465. So, too, an assignment of a building agreement, *i.e.*, an agreement in which the consideration is the grant of a lease so far as it assigns the plant and materials must be registered. See Church *v.* Page (1892) 67 L.T. 800.

An ordinary building agreement between a landowner and a builder is not within the Bills of Sale Acts, in so far as it relates to plant and materials merely by reason of a provision in the agreement, that such plant and materials when brought upon the land, are to be considered as annexed to the land, or are to become the property of the building owner. In this case, the building owner would in any event have a lien on the plant and materials; and they might pass to him by express agreement.

A mortgage, however, by a builder of his interest in a building agreement, and to secure money advanced to enable him to carry out the building agreement, differs very materially from a mere building agreement; and if it includes plant and materials it must be registered as a bill of sale.

Since the bank has foreclosed the assumption is that the mortgage was duly registered. The bank is, therefore, in the position of a "secured creditor," whereas the enquirer's position is that of an unsecured creditor and with no redress. He can only take a dividend if one is available, and since it is said that there are no assets, "R. W." must unfortunately suffer loss, as others have done in like circumstances, and when by seeking proper advice at the outset he could have been protected by customary means.

The fact that the work is being carried on by another contractor does not affect the question.]

Various.

SIR,—I should be glad to hear of (1) Makers of the little Yorkshire cooking stoves, with prices, &c.; (2) to receive quotations for well matured concrete blocks, 18 in. × 9 in. × 4½ in. and 4 in., both smooth-faced and rough, for external walling, from makers within practical road distance of Wokingham; (3) what is a fair price for concrete walling, ex-cuttings, walls, 4½ in. concrete blocks, 2 in. cavity, and 4½ in. breeze concrete inner wall, built in cement and sand—Reading area ?

"J. V. A."

Stains on Slates.

SIR,—I frequently notice that turrets or hipped roofs that are covered with green Westmorland slates and crowned with an iron or copper cross or finial, flashed with lead, get very badly marked with black stains, that stretch a long way down the roof. It does not seem to show on Welsh slates (except the green Welsh), and I do not remember seeing it when the finial was lead only. Can you or any of your readers suggest the cause, prevention, or cure ?

R. T. BECKETT.

Garage Doors.

SIR,—Can any of your readers suggest an economical, simple, and well-running form of garage door, suitable for a small garage about 8 ft. wide, the doors being about 7 ft. 6 in. wide ? There is thus no room for doors to slide sideways, and I do not like the appearance of a rolling shutter. Ordinary pair of doors can be made to look very nice, but they are apt to blow off their hinges and generally get in the way.

"BUILDING."

Insulating.

[REPLY TO "INSULATION."]

SIR,—Cork certainly has very excellent insulating qualities, but is expensive and not now frequently used. A more usual material is silicate of cotton made up in various forms, and this has been found to be very efficient.

There is, I believe, now on the market an insulating building brick of the ordinary brick dimensions, and largely composed of the above material. Such bricks lend themselves very conveniently to incorporation with new structural work, and perhaps the best use of all can be made of them by constructing the wall as ordinary cavity walls, the inner skin being in the insulating bricks with the outer in ordinary brickwork, thus gaining the additional advantage of the air cavity to check the transmission of heat. The ceiling can be covered with slabs of the same material. There are various firms that specialise in insulating material, and their help would be advisable. Names and addresses can be obtained from any good trade catalogue.

"L. X."

We have received a letter from a correspondent, in reply to "Insulation," dealing with another method of insulation, and this has been forwarded to "Insulation."

Wages on Public Works.

The Public Works Conciliation Board has fixed the award, dated June 23, for the London Area, namely: The City and County of London and the whole of the districts of all the local authorities, the whole or any part of whose district lies within the Metropolitan Police district.

The award fixes the rate of wages, to be effective for the three months, July, August, and September, as follows:—Blacksmith, 1s. 8d.; concrete leveller, 1s. 3½d.; duct or earthenware drain layer, 1s. 4½d.; fitter, 1s. 8d.; granite mason kerb, &c., 1s. 9d.; granite sett dresser, 1s. 8d.; jointer, 1s. 4½d.; kerb fixer, 1s. 8d.; pavior, 1s. 8d.; petrol locomotive, petrol roller, or petrol air compressor plant driver, 1s. 5½d.; pipe jointer (iron up to 6 in.), earthenware or concrete pipes and conduits, 1s. 4½d.; pipejointer (iron) above 6 in. diameter, 1s. 5½d.; platelayer, 1s. 4½d. to 1s. 5½d.; platelayer labourer, 1s. 3½d.; pneumatic pick operator, 1s. 4½d.; rammerman, 1s. 4½d.; scaffolder, 1s. 6½d.; screeder, 1s. 4½d.; steam roller driver, 1s. 7½d.; street mason and flag dresser, 1s. 8d.; tarpot man, 1s. 3½d.; timberman, 1s. 4½d.; wood block layer, 1s. 4½d. Men working in "boots," 1d. per hour extra; watchman, 7s. 6d. per shift minimum day or night.

The hours of labour and overtime rates remain as before.

LAW REPORT

Court of Appeal.

The Master of the Rolls and Lords Justices Warrington and Sargant.

Leeds Ancient Light Case.

Slack *v.* Leeds Industrial Co-operative Society, Ltd.

This action again came before the Court last week.

The plaintiff, Mr. C. H. Slack, a wholesale baker and confectioner and the owner and occupier of premises on the west side of Albion-square, Leeds, brought the action against the defendant society, the owners of 11, 13, and 15, Albion-street, Leeds, for an injunction to restrain the defendants from erecting on the site of those premises, which if carried to the height proposed, would cause, it was alleged, a serious and substantial interference with the curtain of the plaintiff's ancient windows. Mr. Justice Romer, who heard the action in the Chancery Division, upon the evidence held that the plaintiff was entitled to an injunction, which he granted; but he stated that he would have preferred to award damages in lieu of an injunction, but he thought that upon the authorities he had no jurisdiction to do so in the case of a threatened wrong. The case then went to the Court of Appeal, where the sole question argued was whether the Court had jurisdiction to award damages in lieu of an injunction in the case of a threatened wrong, and the Court on that occasion, by a majority of the Lords Justices, upheld the view of Mr. Justice Romer that it had no jurisdiction to award damages in lieu of an injunction. The case was then taken to the House of Lords, where by a majority of the Law Lords it was held that the Court could grant damages in lieu of an injunction in the case of a threatened wrong, and the action was remitted to the Chancery Division for the case to be tried on its merits; but it was decided to take the case straight to the Court of Appeal for the Court to decide the matter, having regard to the fact that Mr. Justice Romer had expressed the opinion that he would have granted damages in the place of the injunction if he had had jurisdiction to do so.

Having heard the arguments of counsel and the evidence, their lordships held, following the rule laid down in the case of Colls against the Home and Colonial Stores, Ltd., by the House of Lords, that damages should be awarded the plaintiff in lieu of an injunction, the Master of the Rolls, stating that it would be a very serious matter to prevent the defendants from making the best use of the site, having regard to the nature of the buildings in the proximity of Albion-square and the importance of the ordinary development of that part of an industrial town like Leeds.

The order for an injunction was accordingly discharged, and the case remitted for the purpose of damages being ascertained, either before an official referee or, if the parties agreed, before a special referee.

Nigerian Timber.

Those interested in the building trade should be interested in the timber exhibit in the Nigerian section of the Wembley Exhibition arranged by the British Nigerian Co., Ltd., for the Nigerian Government. It is, perhaps, a little-known fact that the resources of Nigeria are capable of supplying practically every want of the builder. Mahogany, equal to the best-known varieties, can be obtained of the same quality, but much lower price. Walnut, which is employed in the construction of most of the furniture in the exhibit, is also another Nigerian product. Cheaper substitutes of these woods can also be obtained. Another wood assured of a future is ekki (African red ironwood), probably the hardest and most durable timber known. The resources of West Africa are almost inexhaustible, and it seems probable that with the deforestation of the better-known timber-supplying countries, Nigeria will become the chief source of supply.

THE WEEK IN PARLIAMENT

WESTMINSTER, *Wednesday.*

Vibration of Heavy Motor Traffic.

MR. GOSLING, Minister of Transport, informed Sir W. Davidson that he had no statistics as to the approximate number and value of buildings which had been damaged or collapsed as the result of vibration due to heavy motor traffic in London. The remedy for this vibration lay not in the placing of further limitations on the weight and speed of heavy motor-cars, but rather in the strengthening and improvements of road surfaces, a process which was being pushed forward as rapidly as circumstances permitted.

Direct Labour.

Mr. T. Johnston asked the Minister whether he was aware that houses built by the Building Workers' Guild at Irlam were £260 cheaper than the same size and quality of houses built by profit-making contractors; that houses built by the Office of Works at Pontypridd were £194 per house cheaper than the private contractor's prices; that the direct labour scheme at Norwich saved the city £25,000 on contractors' prices; that direct labour at Tonbridge saved £200 per house; that direct labour at Southgate saved £350 per house; and that direct labour at Bentley saved £200 per house; and if he would see that facilities and encouragement were given to local authorities to set up local works departments.

Mr. Wheatley said he was unable to check the figures given and should be glad to hear on what they were based. In some of the cases the final accounts of the housing schemes had not yet been received. He was quite prepared to encourage a local authority to undertake building by direct labour if satisfied that the authority could make efficient arrangements for the supervision of the work and that the method was likely to prove financially advantageous to the ratepayers.

Mr. D. G. Somerville: Is it not a fact that the figures now quoted do not include overhead or departmental charges at all, and that in many cases the accounts have not yet been settled?

Mr. Sunlight: Is the Minister aware of the failures of attempts to build houses in this way?

Mr. Wheatley: I had no previous knowledge of these figures; I have seen them now for the first time. My answer is based on my own experience in other places.

Price of Bricks.

Mr. Ayles asked the Minister of Health whether he was aware that a Bristol firm recently raised the price of bricks in Bristol by 4s. 6d. per thousand for common engineering and stock bricks, and 5s. per thousand for all other bricks; and whether, in view of the adverse influence this had on the cost of house building, he would take immediate steps to stop these increases by giving municipalities power to take over the brickyards within their area or in their vicinity, or by other means.

Mr. Wheatley said he had not received information concerning the particular case referred to. He was proposing in the Building Materials (Charges and Supply) Bill that the Government should be given extensive powers to deal with unreasonable prices.

The Subsidy.

Mr. Hobhouse asked the Minister whether, in view of the shortage of houses and the small rateable value of the smaller urban districts, he would consider so amending the financial provisions of the Housing Bill as to place those areas in the same position with respect to the subsidy as the purely agricultural districts.

Mr. Wheatley said the Government carefully considered the matter referred to, but it was not found possible to make provision for additional assistance for the areas in question. He had undertaken, however, that on the occasion of the first review of the amount of Exchequer subsidy which, under the new Bill would take place in 1927, the case of these areas should again be specially considered.

Local Authorities and the 1923 Act.

Mr. Mills asked the Minister if his attention had been called to the number of local authorities who were refusing to co-operate in any way with any of the provisions of the 1923 Act; and whether, in view of the anxiety among houseless citizens to build houses for themselves, he could outline any scheme by which central application might be made subject to proposed houses conforming to local by-laws.

Mr. Wheatley said he was advised that all local authorities in whose areas serious pressure for houses could be said to exist had already taken some action under the 1923 Act either directly or by assisting private enterprise. He trusted that under the new Housing Bill such action might be widely developed but he thought it undesirable and probably impracticable to deal centrally with individual applications from all parts of the country.

Smoke Abatement Bill.

Mr. Wheatley informed Mr. E. D. Simon that the Smoke Abatement Bill would be introduced in the House of Lords in the next few days.

Slum Clearances Schemes.

Mr. Wheatley informed Mr. Gilbert that three slum clearance schemes in the County of London were confirmed in 1923 and 1924, comprising 668 houses, an area of approximately 13 acres, and a population of 3,760. Several other schemes were under consideration.

Mr. Greenwood informed Mr. Naylor that the Act of 1923 provided for an Exchequer contribution on a half-and-half basis towards the cost of slum clearance schemes (including the rehousing of the occupants) undertaken by local authorities. Since 1919 eleven such schemes had been confirmed in the county of London, and others were under consideration.

Size of Subsidy Houses.

Mr. T. Thomson asked the Minister, with regard to his recent negotiations with the representatives of local authorities as to the terms of his new Housing Bill, what steps he took to resist their demand that the subsidy should be limited to the small type of houses specified in the Housing Act of 1923.

Mr. Wheatley said he was satisfied that if local authorities built sufficient of the larger size of houses specified in the Act of 1923, the housing conditions of the country would be much improved. There was nothing in the Act to prevent local authorities building a larger type of house, but it was felt that the country could not subsidise them.

Houses Needed.

Mr. Wheatley informed Mr. E. D. Simon that while it was not practicable to make a close estimate of the total number of houses required, he was satisfied that the Government were not over-estimating the need in aiming at the production of 2,500,000 houses for Great Britain during the next fifteen years.

Mr. D. G. Somerville: Does the right hon. gentleman still anticipate that 2,500,000 houses will be built in fifteen years? Mr. Wheatley: Yes; at least that number.

Guild Contracts.

Mr. Wheatley informed Mr. Baker that when the Housing Bill was passed, he would be prepared to consider the arguments for and against guild contracts on their merits in consultation with the local authorities and the Advisory Committees which he proposed to set up; but at present he could go no further than that.

Rural Needs.

Mr. Greenwood informed Mr. E. Brown that according to the reports made by rural district councils in 1919, 83,659 houses were required during the subsequent three years in rural districts to meet unsatisfied demands, and 66,751 to replace unsatisfactory houses. Since that date, 56,618 houses had been erected in rural districts with State assistance, and a further 11,907 were in course of construction. In addition, 22,425 houses were erected by private enterprise without State aid during the year ended March 31 last, and a further 11,288 were in course of construction at that date. It was estimated that roughly one-third of the parishes in rural district council areas would not be treated as agricultural parishes for the purpose of the increased subsidy under the proposals in the new Bill.

Office of Works Houses.

Mr. Jowett, First Commissioner of Works, informed Mr. Westwood that the numbers of houses built by direct labour by the Office of Works during the years in question were as follows:—

1919	56
1920	48
1921	1,169
1922	1,428
1923	1,893
	4,594

The following statement was submitted to the Public Accounts Committee in 1923, showing the average cost per house under building schemes carried out by the Office of Works by direct labour as compared with similar schemes carried out for local authorities under contract in the same area and during approximately the same period:—

Area.	(1) Schemes carried out by the Office of Works.		(2) Schemes carried out for adjacent Councils.	
	A 3.	B 3.	A 3.	B 3.
	£	£	£	£
London	877 ..	978 ..	912 ..	1,010
Provincial—				
Birmingham		776		926
Durham	734 ..	880 ..	896 ..	1,005
Hull	643 ..	749 ..	811 ..	926
Kent	669 ..	695 ..	879 ..	1,001
Wales	690 ..	832 ..	727 ..	866

Note: The figures in column 1 are exclusive of the cost of land, roads and sewers, and of a headquarters' charge of 2·75 per cent. to cover Office of Works expenditure on architects', quantity surveyors' and other services.

Those in column 2 are exclusive of the cost of land, roads and sewers, architects' and quantity surveyors' fees, and salaries of clerks of works. Type "A 3," non-parlour house with three bedrooms; Type "B 3," parlour house with three bedrooms.

Concrete Roads.

Captain Brass asked the Minister of Transport whether his attention had been called to the grave risks run by all motor traffic travelling on the new concrete roads in wet weather; and, whether, in view of this danger to the public, he would consider the question of cancelling contracts for such roads and substituting therefore contracts for roads with a less slippery surface.

Mr. Gosling said a slight degree of slipperiness in certain states of the weather was, he feared, part of the price we had to pay for the smooth, durable surface which modern traffic demanded. He was not aware that concrete roads were peculiar in this respect, and he saw no grounds for advocating the cancellation of contracts.

The Society of Architects.

The jury of assessors in the Society of Architects' Victory Scholarship Competition, for a Reception Pavilion in an Exhibition, have selected nine drawings in the preliminary competition by the following competitors:—R. H. Brentnall, Bristol; A. C. Todd, Liverpool; A. C. Townsend, Liverpool; J. Addison, London; A. E. Cameron, London; Miss A. M. Hargroves, London; C. H. Short, London; S. Thomson, London; G. A. Butling, Liverpool.

The Final Competition will be held on August 9, the title of the programme for which will be disclosed to the competitors seven days beforehand. The whole of the Esquisses are on exhibition at 28, Bedford-square, from 10 a.m. to 5 p.m. daily, until Friday, July 11, inclusive.

THE BUILDING TRADE

THE HOUSING BILL

The most satisfactory feature in the second reading of the Housing Bill was that the Bill, contrary to the wishes of the Government, was committed to a Committee of the whole House. A Bill such as this, involving huge commitments extending over such a long period, should never be considered merely by a Committee "upstairs," and there is a further advantage in the Bill being considered by Committee of the whole House, for such a course gives it a better chance of being considered on its merits apart from party politics, although the present conditions of parties in the House, we fear, inevitably leads to a certain amount of "window dressing," each Party having an eye upon a possible general election.

The Minister of Health certainly did not succeed in the second reading debate in explaining away the inherent difficulties in his scheme, or add to any of the arguments or statements he made when bringing forward the "money" resolution. The Government have evidently felt that the Bill should justify itself in a period of three years, or they would not have taken powers to terminate all contributions at the end of that period in clause 4. Yet those arrangements justify no such conclusion. The Minister laid great stress on the so-called agreement with the building trade, which he asserted would contribute to the certain success of his measure; but what does that agreement on his own showing amount to? That building labourers are to be taken in, and the skilled trades are to be augmented by the admission of apprentices, raising the age from the limit of sixteen years to twenty. The success of the scheme, in the admitted shortage of skilled labour, therefore, depends on these young men or youths whose term of apprenticeship was not to exceed four years. The rule that the "pace of the fleet is that of the slowest ship," in other words, according to the Minister, that the output of the bricklayer is determined by the slowest bricklayer in his group, has not been relaxed, and thus the campaign is started with an army deficient in numbers and ill-equipped, and the only recruits which are to be available must be in training for some four years, whilst the Minister, by clause 4, has reserved power to scrap the whole scheme in three years, and thus the much-vaunted guarantee to the building trade is of little value.

In the country there is a large body of persons accustomed to building and dealing with the very class of dwelling-house now required—the private builders—who in the past have supplied those dwellings and often owned them, and who would have continued to do so without charges on the public had it not been for economic causes beyond their control. In 1910 their enterprise was first checked by an impossible and ill-devised system of taxation, and when the war came their property was placed under restrictions imposed upon no other class.

It has been said that private enterprise in building is dead, but what are the facts? The very day after the report of Mr. Wheatley's speech was published there was published a statement made by Mr. Wheatley in reply to Sir Kingsley Wood showing the position of housing schemes under the Act of 1923. That statement shows:—

Houses authorised by the Minister of Health up to June 11, 1924—

To be erected by local authorities...	49,937
,, ,, private enterprise	92,380

Houses included in definite arrangements on or before June 1, 1924—

Schemes of local authorities ...	
Number of houses included in contracts or in approved direct labour schemes	30,597
Private enterprise—	
Number of houses included in undertakings given by the local authorities under section 2 (3)	57,225
Number of houses approved by the Minister under section 3 and included in contracts ...	4,742

Under a third table, building progress at June 1, 1924, we find—

	Schemes of Local Authorities.	Private Enterprise.
Foundations completed ...	7,409	15,470
Roofed in	5,343	11,280
Total under construction ...	12,752	26,750
Completed	5,471	8,532

The dead seem extraordinarily quick!

We know that the Minister will say that the houses erected by private enterprise are only for sale, and that he is trying to provide houses which must be let, so now we will see the kind of encouragement he is offering private enterprise to erect houses for letting.

To the local authority he gives a subsidy of £9, leaving private enterprise with £6. That is the encouragement given to expiring private enterprise, which according to Mr. Wheatley has come to him for protection and advice. The essential of any Housing Bill should be that private enterprise should be given equal opportunities and not that the municipalities and local authorities should be given a preference.

It must be remembered that Mr. Wheatley, in his speech on the second reading, deplored the fact that the country had accepted the principle that the business of the country should be carried on by private enterprise, and said he thought that form of enterprise should be scrapped, but said he had strived to act as an honest man among the competing people. (We quote from the Parliamentary report in the *Times*.) We, of course, impute no other motive to the Minister of Health, but we do claim that private enterprise in his scheme should be put on an equality with the local authorities. In the course even of the next fifteen years this difference of £3 in the subsidy will make all the difference when the houses built under the scheme come to be let, especially when rents come to be decontrolled, and those rents will fall more quickly the greater the competition, and competition must come from private sources.

Therefore we emphatically contend that in this Bill private enterprise should be placed on strict equality with the local authorities, and the private builder should be given the same opportunities of offering his houses at the same rent as the State-aided local authorities.

It is urgent that party politics should, as far as possible, be laid aside in considering this national question, and it is very unfortunate that owing to the money clauses there is great difficulty in effecting any amendments in this Bill. The wisdom of the House of Commons should be concentrated upon it and all parties should be free to suggest amendments of a practical nature; but there is great ground for fear that it may be found that the House may be forced into the position that the Bill must either be taken as it is or be rejected altogether. That would make an undesirable party measure of this Bill, and it would be used for party purposes at any election, and this would be most undesirable.

We hope the Bill will be found capable of being amended and otherwise being considered on its merits, but we must point out once again its effect.

In the future the whole working class will be housed in municipal dwellings, in so far as they desire to rent and not to buy their houses, and the private landlord will be wiped out. Private enterprise in letting houses will be an impossibility in face of competition with the subsidised local authorities, who, moreover, may well find that the rates can be drawn upon to meet current charges if necessary. The local authorities will be placed outside competition, and the restriction on rents imposed by the Bill, which is impracticable, being made with reference to a fixed date, August 3, 1914, will prove illusory in practice, and thus eventually they may be able to fix what rents they choose. The local authorities are not always the best or most sympathetic landlords, and the country should take careful thought before they nationalise in this sense the working-class dwellings.

THE BUILDING TRADE DISPUTE

Mr. T. Shaw, M.P., Minister of Labour, in his efforts at mediation in the dispute, met representatives of the Executive of the Operatives' Federation at the House of Commons last Monday. After a further interview with the operatives and the Disputes Committee of the employers' federation, the following statement was made by the employers:—

"Mr. Coppock attributes to members of the National Federation of Building Trades Employers unconstitutional acts by paying rates of wages other than those negotiated by the Wages and Conditions Council. In doing so he fails to distinguish between payments by our members and payments by many other employers of building trades labour who are not under any agreed obligation to observe the negotiated rates. The prevailing shortage of certain classes of labour has caused such people to offer special inducements in order to attract a supply, but in the overwhelming majority of cases federation members have been entirely loyal to the agreements entered into. However the case may be, it is quite clear that the acts Mr. Coppock complains of could not take place except with the connivance and co-operation of his own members.

"Mr Coppock also states that the last section of the lock-out notice is a breach of the Wages and Conditions Council's agreement inasmuch as the purport is to enter into an agreement with those who are not controlled by the decisions of the Council. The contrary is the fact. So far from the federated employers proposing to enter into arrangements with those uncontrolled by the conditions of the Council, the federated employers are merely continuing the Council conditions in respect of all those they propose to retain in their employ when the lock-out takes place. Mr. Coppock's federation, however, is guilty of a formal breach of the Council's constitution by directing its regional officers to approach the employers in each region with the object of inducing them to make separate regional or local agreements—a thing they are expressly forbidden to do by the constitution of the Council.

"Also Mr. Coppock says that the employers are using the alleged breach of agreement at Liverpool as a case for a national lock-out. The origin of the Liverpool situation was itself the breach of an agreement on the part of the operatives concerned and it is now a breach of an award of the National Wages and Conditions Council. But the employers only regard the Liverpool position as the culminating case in a prolonged series of breaches of agreements and of attempts to undo the effect of the award of Sir Hugh Fraser which purported to settle the dispute of twelve months ago. . ."

The Minister of Labour announced on Wednesday that he would cause a public Court of Inquiry to be held into the cause of the dispute. The lock-out notices will take effect on Saturday unless agreement is reached beforehand. Conferences of the representatives of the employers and operatives were being held when we went to press.

THE LAW RELATING TO BUILDING

By W. T. CRESWELL, Lic.R.I.B.A., F.R.S.I. (Barrister-at-Law).

XI.—THE CONTRACT (2).

Entire or Lump Sum Contracts.

A building contract, by which it is agreed that a fixed sum of money shall be paid by the employer to the contractor by way of consideration for stated labour and materials done and provided, the contractor doing the whole of the work to completion, is called a "lump-sum" or "entire" contract. No payment is recoverable by the contractor for work or material, thereunder, until completion, unless there is a clause for interim payments, or unless the employer or his agent has obstructed the performance of the contract. Incomplete performance disentitles, by default, the contractor to any payment not already made, and leaves him liable, further, for non-performance. A contract is still "entire" if payment is to be made at completion on measurements and a schedule of prices, by valuation or by arbitration. A contract for labour only, excluding materials, is not usually construed as an "entire" contract. In some cases where payments are made apportionable and to be due as the benefit accrues the entirety of the contract may be thereby destroyed; that is by the divisability of the contract.

In Sumpter *v.* Hedges (1898), 1 Q.B. 673, the plaintiff had abandoned his contract, and A. L. Smith, M.R., said: "The law is that where there is a contract to do work for a lump sum, until the work is completed the price of it cannot be recovered."

When non-completion is not due to abandonment by the contractor, but to obstruction by the employer, the former may recover on a quantum meruit. See Dakin & Co., Ltd., *v.* Lee (1916), 1 K.B. 566.

There may, of course, be further conditions, precedent to payment included in the contract, such as the approval of the architect or employer, or both.

In Appleby *v.* Myers (1867), L.R. 2 C.P. 651, there was a contract by plaintiff to erect certain machinery, at specified prices for particular portions, each for each, and to maintain in repair for two years, the cost to be paid on completion of the whole. Whilst some portions were complete, and others incomplete, accidental fire destroyed the whole—machinery, materials, and the pre-existent premises. Both parties were held excused of further performance, and the plaintiff could not claim for those portions he had completed prior to the fire.

Contracts of Measurement, Schedule of Prices, etc.

A measurement contract is one to execute to completion works, at a price to be ascertained by measurements taken and referred to in an agreed schedule of prices. It is equally an "entire" contract, as one in which a lump sum cost is agreed. See Appleby *v.* Myers (1867), L.R. 2 C.P. 651.

The contractor is under an obligation to complete the whole at the rates in the schedule, in so far as they can be applied thereto; and where the work does not come under the descriptions included in the schedule, then at reasonable prices.

In Walton-on-the-Naze U.D.C. and Moran (1905) Hudson on Building Contracts (Vol. 2) 376, there was a contract which included a "cast iron outlet pipe to low water mark." The plan showed the pipe extending to low water mark, but the section showed a further extension into the sea of 279 ft. There was a priced bill of quantities, and the length of pipe taken was that shown in the section, but no special rate was shown for under-water works. The work was carried out according to the section, and the last, about 279 ft. were beyond low water mark. The contractor claimed, and was awarded, extra payment, based on an increased rate, for the portion beyond low water mark. It was held that the price in the schedule, for work to low water mark, could not be applied to the extension beyond. In a measurement contract there is no implied agreement that it is divisible in the sense of payment, for work done at any juncture, being then due.

The fact that a schedule of prices omits any special item shown on the drawings does not free the employer from liability to pay for such work when done. However, the contractor must execute such an item as it is shown and described, as being essential to the satisfactory completion of the job; and he must trust to exacting fair and reasonable payment. If no price is fixed in an entire contract, as, for example, a contract by deed, the contractor is bound to complete and the employer is bound to pay quantum meruit. See Whittle *v.* Frankland (1862), 2 B. & S. 49.

An agreement to do repairs and make perfect a specified work has been held to constitute an entire contract, remuneration becoming due at completion of the service rendered.

When variations have been ordered and carried out, they cannot be put forward to support a claim for setting aside the lump sum and pricing out the whole work by measurements. They must be treated separately as extras, and the payment involved added to the lump sum, omissions being deducted therefrom if provided for by the terms of contract. See London Steam Stone Saw Mills *v.* Lorden (1900), Hudson on Building Contracts (Vol. 2) 301. That is to say, the bill of quantities defines the extent of work to be done for the lump sum, and any work beyond this limit, which the contractor is requested to do, and performs, must be paid for in addition to the said lump sum. See Patman & Fotheringham, Ltd. *v.* Pilditch (1904), Hudson on Building Contracts (Vol. 2) 368.

Sub-Contracts and Sub-Contractors.

In order to secure an invitation to any special sub-contractor in whom the employer has confidence, or to give the employer power to determine the contract in the event of the general contractor going bankrupt, it is usual to insert a clause stipulating that there shall be no subletting or assignment of any part of the works, without the express consent of the employer.

However, the sanction of custom permits much subletting, especially for such works as tiling, slating, plastering, steelwork, heating, lighting, etc. But it is in the discretion of the employer or his agent to object to any sub-contractor under the above stipulation; and if any such is introduced without the consent of the employer, the general contractor is guilty of an invalid act. See Ryan *v.* Willoughby (1900), 31 Can. S.C.R. 33. Also, if the consent of the employer is not a condition and the general contractor sublets at his own discretion, he is liable to the employer for defects and default. See British Waggon Co. *v.* Lea (1880), 5 Q.B.D. 149.

A contract between the general and the sub-contractor binds these parties exactly as the general contract binds the employer and general contractor; and it is usual to embody, or refer to, any clauses of the general contract, which affect the sublet work and its completion when drawing up the subcontract.

Subletting may be governed by a provisional or prime cost item, and the desired sub-contractor named or left to the choice of the employer at the time the work or article is

COMPARISON OF PRICES OF BUILDING MATERIALS BETWEEN AUGUST 4, 1914, AND JULY 1, 1924

Material.	Aug. 4, 1914. £ s. d.	Nov. 11, 1918. £ s. d.	June 1, 1924. £ s. d.	July 1, 1924. £ s. d.	Rise or Fall during Month. (Per cent.)

Red Lead	28 10 0	47 0 0	52 0 0	52 0 0	—

required on the job. The latter course permits the employer the advantage of competitive prices and current rates.

Contracts with Public Bodies.

Under various Statutes contracts with Government departments, public bodies, and all corporations aggregate must, in general, be made under seal. See Hunt *v.* Wimbledon Local Board (1878), 3 C.P.D. 208, and Young *v.* The Mayor of Leamington (1883), 8 App. Cas. 517.

Breach—Petition of Rights.

Government contracts are those where payment is to be made from funds voted by Parliament. Some are made with the Crown and others with other public bodies—and in case of breach by the contractor it is the Attorney-General who enforces the terms of these contracts; whilst any grievance of the contractor, he being a "subject," can only vent in a Petition of Rights, which may be written or printed and addressed in a prescribed form to the Sovereign—the form is in the schedule to the Petition of Rights Act, 1860. This is to be left at the Home Office "that right may be done," and the granting of the fiat is an act of grace.

Variations under a Sealed Contract.

If any contract is by statute under seal, any variations of such contract must also be made under seal. See Ranger *v.* G.W. Rly. (1854), 5 H.L.C. 72.

Remuneration under a Sealed Contract.

It is generally accepted that contracts entered into with municipal corporations must express the intention of the body corporate; and this can only be satisfactorily signified by authorised persons affixing the seal of the corporation. The sole exception is that officials of an urban council may enter into contracts for the U.D.C. up to £50 value of work, without the seal of the corporation. This check is in the interests of the ratepayers as quasi-shareholders. Conversely, the other party to a contract with a corporation, which has omitted to affix its seal under the statute, cannot be sued for any breach of the contract. See Wandsworth Board *v.* Heaver (1885), 2 T.L.R. 130.

In Lawford *v.* The Billericay R.D.C. (1903), 1 K.B. 772, it was held that the absence of the seal of the corporation was no answer to a claim for payment for works done or goods supplied under such unsealed contract, when the works done, or goods supplied, were necessary to carry into effect the statutory powers vested in the corporation or the purposes for which it existed as a public body. But, in Baker *v.* Holme Cultram U.D.C. (1915), 85 L.J. K.B. 799, it was held that Parliamentary agents could not recover fees under an unsealed contract, nor on a quantum meruit.

It is also interesting to note that under the restriction or permission to U.D. Councils to make contracts up to £50 value without seal, that it would appear a contract made for a sum not exceeding £50 per day is enforceable although the first demand may be for a large accumulated amount; the argument being that the contract value is the daily rate of remuneration only. See Eaton *v.* Basker (1881), 7 Q.B.D. 529.

Again, in a recent case, Nixon *v.* Erith U.D.C. (1924), 40 T.L.R. 1, 1 K.B. 87, it was held that the plaintiff, a quantity surveyor, could not recover fees for quantities he had prepared and professional services rendered because his instructions were taken from the architect, and he had no contract under seal of the corporation. The decision in the case referred to above, of Lawford *v.* Billericay R.D.C., was pleaded as a precedent, but it was stated that the principle in that case would only extend to contracts made in the fulfilment of a duty imposed by Statute on any corporation, other than an urban authority.

But it is not prudent for anyone to execute any consideration for a corporation without first obtaining the seal.

RATES OF WAGES IN THE BUILDING TRADE.

The following are the rates of wages in the building trade in England and Wales. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Bricklayers.	C'p'ters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Labourers.
Aberdare	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2¾
Accrington	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2¾
Altrincham	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2¾
Ashton-under-Lyne	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2¾
Barnsley	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2¾
Barrow-in-Furness	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2¾
Barry	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2¾
Bath	1/5½	1/5½	1/5½	1/5½	1/5½	1/5½	1/5½	1/1½
Bedford	1/5	1/5	1/5	1/5	1/5	1/5	1/5	1/0¾
Birkenhead	1/9	1/9	1/8½	1/9	1/9	1/9	1/8½	1/4
Birmingham	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2¾
Bishop Auckland	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2¾

(For rates of wages in the Building Trade in Scotland, see page 30.)

THE SCOTTISH BUILDER

NEW BUILDINGS IN SCOTLAND.

Aberdeen.—HOUSES.—The Corporation Housing Committee, after consideration of a report by Dr. Kelly, City Architect, and Mr. J. T. Sorley, Town Chamberlain, decided to ask the Scottish Board of Health to include 20 additional houses in the sixth housing development of the Council. The Corporation Plans Committee has approved of plans of six houses at a cost of £8,300, and of alterations to eleven existing buildings, at a total cost of £2,645.

Arbroath.—BUNGALOW.—The Dean of Guild Court has passed plans for a bungalow in Salisbury-place, and two semi-detached cottages in Green-street.

Govan.—HOSPITAL.—Messrs. James Keppie & Henderson, Glasgow, are preparing plans of a new hospital for the West of Govan and District. This project is being developed under the Elder Bequest Fund. A site has been secured on Moss-road, at the junction of Berryknowes-road and Llanglands-road.

Edinburgh.—OFFICES.—The Midlothian E.C. intend to borrow £4,000 for the purchase and alteration of 9, Drumsheugh Gardens, for administrative Offices.—VARIOUS.—The Dean of Guild Court has passed the following plans: John Brown & Son, two villas at Brunstane-road; Thomas S. Henderson, bungalow, at Hillview-terrace, Blackhall; Miss Lang, bungalow at Cairnmuir-road, Corstorphine; Alexander Murdoch, two semi detached houses at Dovecot-road, Corstorphine; D. C. White, conversion of self-contained house at 10, Buckingham-terrace, into three separate houses.—Representatives of the Lord Provost's Committee and the Housing Committee of the T.C. have paid a visit to Calton Jail with a view to ascertaining the possibility of using the building for housing. It was agreed to remit the matter to Mr. Horsburgh Campbell, the Housing Director, to prepare a report.

Coupar Angus.—SCHOOL.—The T.C. has passed plans which were submitted by the E.C. for additions to Coupar Angus School. The new buildings will be erected on the vacant ground to the west of the present school.

Helensburgh.—REBUILDING.—At a meeting of the Dumbarton U.F. Presbytery held recently, plans were approved for the rebuilding of Helensburgh West Church. The cost is estimated at between £14,000 and £15,000.

Menstrie.—SCHOOL.—The Clackmannan C.E.C. has the architect's plans and an estimate at £2,400 for additions to Menstrie School under consideration.

Tillicoultry.—HALL.—The T.C. has approved of plans for a new hall in connection with the E.U. Church.

Renfrew.—HOUSES.—The T.C. will invite tenders for the erection of houses in connection with the slum clearance scheme.

Dumbarton.—HOUSES.—The Corporation has decided to proceed with the improvement scheme at Sunnybank, the purchase of which property has now been completed. It is proposed to erect new houses and shops.

Greenock.—HOUSES.—The Corporation Housing Committee has accepted tenders for the erection of 180 houses in the neighbourhood of Sinclair-street, in the east end of the town. The amount of the tenders accepted is £75,000.

Kincardine.—HOUSES.—At a meeting of the Standing Joint Committee for Fife, held recently in Cupar, a report was submitted on various sites throughout the county for the erection of police houses, and it was agreed to proceed with the erection of houses at Thornton, Chapel, Leslie, Windygates, Saline, and Kincardine.

Blairgowrie.—IMPROVEMENTS.—The T.C. has under consideration the question of improvements at the Public Hall.

Gogarburn. — EXTENSION. — The Edinburgh District Board of Control is recommended to extend the present institution at Gogarburn so that additional accommodation may be provided for at least 500 mental defectives.

Alexandria.—HOSPITAL.—It is proposed to provide a cottage hospital for the Vale of Leven. Broomley House, on the Tullichewan Castle grounds has been purchased out of a portion of a bequest of £15,000 under the will of the late Henry Brock, of Darleith, Cardross.

Alloa.—SCHOOL.—The Clackmannan C.E.C. propose to renovate Sunnyside, St. John's, and St. Mungo's schools, and clean and repaint the staffrooms in the Grange School, Alloa, during the summer holidays.

GLASGOW SCHOOL OF ARCHITECTURE

THE following awards (Session 1923–24) have been made by the Glasgow School of Architecture. The External Assessor was Mr. Paul Waterhouse.

McNeil; 3 (£2 2s.) (measured drawings), T. S. Cordiner. J. B. Wilson Book Prize, A. Cordiner. Whitelaw Silver Medallion, J. Miller. Whitelaw Bronze Medallion, J. T. King. School Medallions.—Gilt, L. G. Farquhar, J. Miller; Silver, F. Wylie, G. Bartholomew, R. Ross, A. Purves; Bronze, T. Cordiner, W. A. Macdonald, Ian Macdonald, A. Cordiner, G. Delachy, S. Knowles, Miss McEwan; Hon. Mention, W. P. Robbie, J. B. Russell, F. Murison, Miss Baillie.

Scottish Buildings.

Three additions have been made to the list of Scottish buildings under the guardianship of His Majesty's Commissioners of Works, who, through their Ancient Monuments Department, are taking steps to place them in the best possible state of preservation. These buildings are Lincluden Convent and College, Dumfriesshire, the property of the Duchess of Norfolk, and the two East Lothian castles of Tantallon, which belong to Sir Hew Hamilton Dalrymple, Bart., and Dirleton, owned by Lieutenant-Colonel J. P. Nisbet Hamilton Grant, D.S., of Biel. A f weeks ago the Department opened the Monast of Inchcolm to the public, and it is understo it is their intention to pursue the same pol with every historic building which comes un their care.

Cottage in 1776.

In view of the recent ter-jubilee of Rob Tannahill, it is of interest to note that his fath in 1776, built a one-story thatched cottage at following cost:—

	£ s.
Wood	13 13
Windows	5 4
Wright work	3 16
Mason work	16 9
Plastering	2 10
Roof and Safe Lintels	3 0
Thatch, Twine, and Wages	2 14
Steaching	6 12
Nails	1 3
Sand	1 4
Bricks, Carriage, and Tolls	1 2
Smith work	0 18
Carter's wages and tolls	0 5
Rigging	0 6
Drink	1 14
	£60 16

PROPOSED NEW BUILDINGS & OTHER WORKS *

IN these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations: T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; B.C. for Borough Council; P.C. for Parish Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; and B.E. for Board of Education.

ABERAYRON.—Plans passed by U.D.C.: House for Miss M. A. Jenkins, at Penmaen; house for Miss S. Jones, Mydroilan.

ANNFIELD PLAIN.—The U.D.C. has approved plans for the erection of 26 houses at Carmyers, by the South Derwent Colliery Co., Ltd.

BANSTEAD.—Croydon-lane is to be widened by the Epsom R.D.C., at a cost of £8,762.

BARKING TOWN.—The M.H. has sanctioned the Town Quay extension, to cost £3,792. A site on the Upney Estate, which is to be developed, has been secured for a new elementary school. The General Purposes Committee suggests that the Council should agree to the principle of providing a site in the district in the event of Mr. Fanshawe agreeing to re-erect the Town Hall. Plans passed: Celluloid store, West Bank, for the River Roden Co.; rebuilding Volunteer beerhouse, Abbey-road, for Messrs. Charrington & Co.

BARNES.—The Surrey E.C. has had sketch plans for the proposed secondary school for boys at Barnes, and forwarded them to the U.D.C. for consideration.

BATH.—The Corporation Properties Committee proposes to roof over the Kingston Bath site at a cost of from £2,500 to £3,000.

BEDWELLTY.—The U.D.C. is to reconstruct the bridge at Cwmpenmaen.

BELFAST.—Plans passed by T.C.: Sixteen villas, Nendrum-gardens, for Mr. S. Nelson (Mr. R. Lynn, architect); villa, Downview-avenue, for T. S. Johnson, (Messrs. Hobart & Heron, architects); villa, Myrtlefield-park, for Mr. S. McDowell (Mr. T. R. Eagar, architect); shop, Newtownards-road, for Mr. T. W. Rollins (Mr. G. W. C. Porte, architect); further additions to Royal Victoria Hospital (Messrs. Young & Mackenzie, architects); six villas, College-park, Belmont, for Mr. J. O. Templeton (Mr. John MacGeagh, architect); six houses, Sandhurst-drive and Strandview-street, for Mr. S. McGladery (Mr. A. B. Dobson, architect); conversion of cinema theatre, York-street, into two shops and warehouses, for Mr. T. McManus (Mr. R. Lynn, architect); eight houses, Pretoria-street, for Mr. W. J. Orr (Mr. L. H. Hodgins, architect); maternity home, Malone-place (Mr. Godfrey W. Ferguson, architect); premises, Woodstock-road, for the Northern Banking Co. (Messrs. Tulloch & Fitzsimons, architects); villas, Knock-road, for Mr. R. J. Kerr (architect, Mr. Hugh Gault); rebuilding of premises, for Mrs. Beatrice O'Neill (Mr. W. J. Convery, architect); two villas, Downview-avenue, for Messrs. F. T. Lloyd Dodd & W. A. S. Macpherson; stores and motor garages, Lisburn-road, for Mr. W. H. Sloan (Mr. N. H. Graham, architect).

BIDEFORD.—The partial rebuilding and widening of the Iron Bridge, Landcross, at a cost of £5,000, is included in the Devon C.C. bridge scheme.

BOCKING.—A parish meeting has approved a scheme for the extension of the local cemetery, at a cost of £400.

BOLTON.—Plans passed by T.C.: James Latham, two houses, Greenland-road; W. Higson, house, Lostock Junction-lane; Thos. Blakley, house, Lever Edge-lane; Wm. Heaton & Sons, Ltd., offices, Delphhill Mill; Great and Little Bolton Co-operative Society, Ltd., new shops, Halliwell-road, and rebuilding shops, Venture-street and Steele-street; Deane Conservative Club, club house, back Wigan-road; Thos. Taylor & Sons, Ltd., plant house, Grecian Mills, Lever-street; Albert Bardsley, six houses, Higher Swan-lane; Earl of Bradford, streets and levels, Bromwich-street.

BRADFORD.—Preliminary designs have been prepared by the Town-Planning Department for a new bridge over the River Aire between Greengates and Rawdon.

BRAMPTON. — The R.D.C. has approved a plan submitted by Mr. H. E. Ayris, architect of Carlisle, for the erection of a bungalow at Heads Nook.

BRIDGEND.—The Penybont (Bridgend) R.D.C. has approved plans passed for the proposed Penyfai sewerage scheme, estimated to cost £3,000, and has submitted them for Ministry approval.

BRIDLINGTON.—Plans passed by T.C.: Mr. J. R. Earnshaw, house, Bempton-lane, for Mrs. Young; Mr. S. Dyer, two houses, South Back-lane, for Mr. Holtby; Mr. C. L. Waite, 16 houses, Priory Estate, for Mr. W. Witting; Mr. C. F. Johnson, house, Hilderthorpe-road, for Mr. C. Cooper; Mr. C. F. Johnson, house, Easton-road, for Mr. H. Palmer.

CAMBRIDGE.—Plans passed by T.C.: Three houses, Haig-road, for A. W. Collett & C. H. Woolhouse; two pairs of houses, Huntingdon-road, for S. French; two pairs of houses, Cherryhinton-road, for A. Beavis; house, Leys-road, for Col. W. A. Wood; Harvey Goodwin Home, Harvey Goodwin-avenue, for the Church of England Waifs and Strays Society; house, Church Rate-walk, for Mrs. M. W. Sewell; pair of semi-detached houses, Coniston-road, for G. R. & H. B. Howes; house, Herschel-road, for J. Trevor Spittle; bungalow, Haig-road, for H. W. Jackson; house, Milton-road, for W. J. Balls; house, Glebe-road, for W. Bowett.

CARMARTHENSHIRE.—The Cwmamman U.D.C. is to carry out a scheme of damming the River Pedol.—The M.H. has suggested the making of an additional block to the Llanelly General Hospital as a maternity centre. As against this the B.C. proposes the conversion for the purpose of Park Howard House.

CASTLEFORD.—The C.C. has decided to publish the necessary notice for the proposed erection of a middle school for 600 children at an estimated cost of £24,000. A site has been purchased on the Airedale Housing scheme, 4.18 acres in extent, for the purpose of erecting the Glass Houghton and Airedale new school.

CHERTSEY.—The M.T. has approved of improvement works on the Weybridge-Chobham-Bagshot road, between the Chertsey Urban District boundary and its junction with the Guildford-Bagshot main road, at a cost of £37,750.

CHESTER.—Plans passed by T.C.: House, Westminster Park, for G. Day; organ chamber at St. Mark's Church, Saltney; two houses, Curzon Park, for J. Edwards & T. Moyle; bungalow, Lache-lane, for F. Rowcliffe; four houses and eight flats, Handbridge, for the Duke of Westminster; house, Stocks-lane, for G. Fernside.

CHESTER-LE-STREET.—The U.D.C. has instructed its surveyor to prepare plans and estimates for the erection of a fire station.

CHESTERFIELD.—Application is being made to the M.H. for sanction to borrow £8,000 for the purpose of erection of new baths at Storforth-lane. Plans have been approved for the erection of 74 houses.

CHORLEY.—The T.C. is to proceed with the scheme of extensions at the main sewage works.—Plans passed: Trustees of Cedric Houghton, new premises and alterations to existing anchor premises, St. Thomas's-road and Market-street; Chorley Corporation, additions to sewage works, Common Bank; Exors. of W. Hampson, pair of houses, 17 & 19, Lawrence-road; Mr. H. Pope, house, Euxton-lane; Messrs. W. H. Collison & Son, pair of detached houses, Collison-avenue.—The course of the Clancutt brook near the culvert is to be diverted and a rubble retaining wall built.

COVENTRY.—The City Council proposes to level and drain Radford Common.

CROCKFORD.—Plans for a new bridge have been prepared by the Surrey County Surveyor, who is to negotiate with the Lords of the Manor and other people interested, and also to ascertain whether the M.T. will be willing to make a grant of 50 per cent. of the cost of a new bridge.

CROYDON.—Plans passed by T.C.: Grace & Marsh, Ltd., factory, Aurelia-road; J. Midmer, four houses, Ena-road; J. Midmer, 30 houses, Cedars-avenue; Thorn & Co., house, Crown-lane; S. H. Laver, three houses, 12, 14 & 16, Fernham-road; S. W. Parker, 33 garages, 330 & 332, London-road; H. Payne, bungalow, The Glade, Ham Farm; H. G. Colson, cloakroom, St. Augustine's-avenue, "The Beeches"; Cox & Jones, two houses, Broughton-road; G. H. Dales, two shops and houses, Brigstock-road; F. Bridgland, six garages, Brighton-road, Purley; Crowley Bros., 25 houses, Colliers Water-lane and Dovercourt-avenue; S. Brockwell, bungalow, The Glade, Ham Farm; G. & A. Parris, house, Haling Park-road; C. F. E. Wells, four houses, Lodge-road; Paish, Tyler & Crump, house, Shirley-road; J. Carpenter, two houses, Leicester-road; J. Rodda, four houses, Norbury-avenue; Chart, Son & Reading, four shops with flats over, Brighton-road, Purley; C. Banks, shop, Bingham-road; W. A. Tyler, house, Ham Farm.

DARLINGTON.—The B.E. has given its approval to a sketch plan for the erection of the new Council schools at Cockerton.

DORKING.—The Surrey C.C. has agreed to the proposal of the U.D.C. that the proposed improvement at the junction of High-street with London-road should be commenced at the earliest possible moment, as the first part of the general east and west road scheme in the district.—The M.H. has held an inquiry into the application of the R.D.C. to borrow £14,500 for the purposes of sewerage and sewage disposal for the parish of Capel.

DRONFIELD.—A sewage scheme estimated to cost £2,000 is being considered by the U.D.C. In this scheme it becomes necessary to carry the new sewer under the main line of the L.M. & S. Rly.

DUBLIN.—The Dublin Port and Docks Board have agreed to contribute £12,500 towards the cost of a pedestrian tunnel under the River Liffey. It is estimated that the whole scheme will cost £60,000.—Plans passed: Thirty houses, Vernon-avenue, Clontarf, for Mr. D. Fitzgerald.

DUDLEY.—Plans passed by T.C.: House, Ednam-road, for Miss L. Stainton; alterations, 107 & 108, Hall-street.—Fresh tenders are to be invited by the T.C. for the erection of 52 houses at Woodside.

EGHAM.—The Surrey C.C. notifies the U.D.C. that it proposes to proceed with the reconstruction of Ruins Bridge, Virginia Water, as already arranged with the Office of Works and the M.T.

EPSOM.—The U.D.C. is calling upon the C.C. to make early provision for a secondary school for boys.—The E.C. has prepared plans for an infants' school.

FARNBOROUGH.—Plans passed by R.D.C.: Cow-house, Poplars Farm, Mollington, for Mr. Holbech; house at Sibford Gower, for Mr. James Basham.

FINCHLEY.—The U.D.C. is to carry out an important scheme at Tally Ho! Corner, at a cost of £16,000. The widening of the road from Regent's Park-road to Manor House is proposed, at a cost of £5,867. A footpath diversion is proposed, to facilitate the development of the Oakleigh Park Estate. Surface water sewers are to be laid in East End-road, at a cost of £5,275. Plans recommended: House, Meadway, for Mr. W. Gibson; house, Northway, for Mrs. A. Norton; two houses, Christchurch-avenue, for Messrs. McCann & Dixon;

See also our List of Contracts, Competitions, etc.

Hullord; store and garage, Fermoy-road, Barclay, Perkins & Co.; house, Burges-road, C. Matthews; house, Clieveden-road, Miss C. E. Atkins; bungalow, Cumberland-avenue, Mrs. Kendrick: new roads and sewers, Chalkwell Hall Estate, Chalkwell Hall Trust, Ltd.; two flats, North-avenue, H. Smith; three bungalows, Eastcote-grove, Purkiss Bros.; two houses and garage, Gainsborough-drive, T. Wiggins; two flats, Nelson Mews, J. Vineall; two houses, Lonsdale-road, W. Pennell; house, Central-avenue, C. Leswell; two bungalows, Tunbridge-road, G. P. Harrison; house, Alexandra-road, H. Marriner; conversion of house into shop, Stromness-place, T. Brown; house and shop, Southchurch-road, F. C. Fletcher; conversion of two houses into one, and additions, Leigh-road, Dr. W. Sarra; two flats, Trinity-road, J. Hiller; four houses, Northview-drive, F. W. Taylor.

SPENNYMOOR.—The U.D.C. has decided to carry out a scheme of road improvements, commencing in High-street at the Arcadia, and extending to the Four-lane Ends. The estimated cost is £27,742.

SPRINGHEAD.—The West Riding E.C. are proposing improvements to the Council's school. Plans have been submitted to the West Riding C.C. for the proposed improvement and widening of the main road from Grotton to Lydgate, with a view to making the road a width of 75 ft. The estimated cost is £25,000.

STANSTED.—Plans passed by R.D.C.: Bungalow at Ugley, for Mr. Sawkins: bungalow at Park-road, Elsenham, for Mr. W. Squires; bungalow at Little Hallingbury, for Mr. A. Craven.

STOCKTON.—The T.C. is to provide a further 300 houses in addition to the 100 now sanctioned.—Plans passed by the T.C.: Two houses in Gainford-road, for Mr. A. E. Carter, Finkle-street; six houses in Sydenham-road, for Mr. J. W. Carter, Oxbridge-lane; and two houses in Imperial-crescent, Norton, for Messrs. Blackett's Constructional Co.

STOKESLEY.—Plans have been passed by the R.D.C. for a pair of houses at Yarm, for Mr. A. Coates; house at Yarm, Mr. C. E. Holt; shop and warehouse at Great Ayton, Messrs. Dixon Bros.

STOURBRIDGE.—The B.E. has called attention to defects at the Secondary School for Girls, and the

(Continued on p. 37.)

PROPOSED NEW BUILDINGS

(*Continued from* p. 35.)

County E.C. intimates that it is alive to the need for new school buildings, which will be proceeded with if satisfactory tenders can be obtained.

STREFFORD.—Under a grant from the Miners' Welfare Fund the Strefford Collieries Co., Ltd., have decided to erect pit head baths.

SUNDERLAND.—The R.D.C. has approved plans from private builders for the erection of 27 houses at Fulwell.

SURBITON.—The Westfield Lodge Estate is being developed by Messrs. Jones & Co., and an agreement has been made with the U.D.C. regarding widenings, &c.

—The B.E. has sanctioned the purchase of Allbury House and grounds as a site for a secondary school. Sketch plans for the conversion of the building have been submitted, but the B.E. has asked for preliminary plans for a future complete school for 400 boys, and these plans are now being prepared by the C.C.

SUTTON.—The Southern Railway proposes the reconstruction of the railway station, and in this connection the U.D.C. proposes road widenings, &c., at a cost of £13,852. The U.D.C. is asking for the provision of new secondary schools for boys and girls.

TAMWORTH.—Plans have been approved for a new school for St. John's, which will provide accommodation for 218 scholars.

TAUNTON.—Plans passed by T.C.: House, Peter-street, for Mr. F. C. Spear; house, Winchester-street, for Mr. Lawrence.

TAVISTOCK.—The County Architect has been asked to prepare plans for an additional class-room at the Galworthy council school.

TEDDINGTON.—An elementary school for 400 children is to be erected at St. Mark's-road, by the Middlesex E.C.

THORNABY-ON-TEES.—Pair of bungalows, Thornaby-road, for J. W. McLeod.

THORNE.—The R.D.C. have been considering the question of a sewerage scheme necessitated by increased colliery population, and have passed the scheme prepared by their engineers, Messrs. W. H. Radford & Son, of Nottingham.

THURNSCOE.—Providing that sanction can be obtained for the necessary loans, the U.D.C. propose to undertake the construction of a new reservoir, a £22,000 sewage disposal scheme, and an extension to the present waterworks.

TORQUAY.—The M.H. has approved plans for the erection of accommodation for nurses at the Whitecliff Hospital. The E.C. has submitted an estimate of £4,000 for the purchase of "Torville," and of garden ground lying between "Torville" and the secondary school, to be utilised for the purpose of the erection of a technical school.

TOTNES.—An estimate of £8,500 has been prepared for the erection of a secondary school for girls. The plans provide only for the accommodation which is absolutely necessary and do not include a central hall. The T.C. proposes an improvement at Station-road, to cost £395.

TOTTINGTON.—Plans approved: Pavilion at bowling-green, Two Brooks; bleachworks, for the Bleachers Association. The D.C. propose widening of Church-street to 36 ft. from the lower end of Bank-street, and the formation of footpaths and new footpath between school yard and Bank-street.

UPTON.—The Surveyor to the R.D.C. has been instructed to put down a new 3 in. water main to the Isolation Hospital at an estimated cost of £700.

UPTON PYNE.—The Devon C.C. has prepared plans for the erection of a small-pox hospital, at a cost of £3,000.

UXBRIDGE.—Plans passed by U.D.C.: War memorial at junction of St. Andrew's-road and Park-road.

WALLINGTON.—Sketch plans have been prepared by the Surrey County Architect for the new secondary school for girls, and submitted to the Governors.

WALLSEND.—Messrs. Swan, Hunter & Wigham Richardson, Ltd., have inaugurated a housing scheme in connection with land they own at Station-road. This land will allow for the building of 65 houses.

WALTHAMSTOW.—Plans passed by U.D.C.: Two shops, Winchester-road, Kind & Co.; bungalow, Falmouth-avenue, H. Johnson; store and van shed, Nicholson-road, J. Sands; house, Winchester-road, H. J. Pettit; stores and office, Barrett-road, E. J. Good.

WANDSWORTH.—Plans passed by B.C.: Messrs. W. Downs, Ltd., house, Abbotsleigh-road, Streatham; Hays' Wharf, Ltd., cottage and garage at Roehampton-court, Roehampton-lane; Mr. C. M. Gibbs, house, West-hill, Southfield; Messrs. W. & E. Hunt, club house at Kenilworth-court, Lower Richmond-road, Putney; Mr. E. Wilson, house, Old Devonshire-road, Balham; Mr. J. R. Smith, re-drainage of 38, 40 & 42, Nelson's-row, Clapham South; Mr. H. R. Thorp, four houses, Moyser-road, Streatham; Messrs. T. H. Adamson & Sons, additions to 3, Gressenhall-road, Southfield; Mr. F. Dickins, seven houses, King's-avenue, Clapham South; Messrs. H. F. Buchan & Co., 22 houses in Byrne-road and Culverden-road, Balham; Mr. W. J. F. Gillett, three houses, Valley-road, Streatham; Veritas Mantle Works, collodion house, Garratt-lane, Fairfield; Messrs. H. & T. Danks (Netherton), Ltd., boiler house, &c., at Columbia Graphophone Co.'s premises, Bendon-valley, Springfield; Wandsworth Borough Council, depot stores and storekeeper's apartments at Streatham Depot, Streatham High-road.

WEALDSTONE.—Plans approved: Two houses, Whitefriars-avenue, for the Guild Housing, Ltd.; house, Kenton-road, for Mr. A. Chivers; two houses, Nibthwaite-road, for Messrs. Brooker & Jarvis.

WEST HARTLEPOOL.—Plans passed by T.C.: Captain W. J. Brackenbury, two houses and garages, Tudor-terrace, Seaton Carew; Mr. E. Mehegan, bungalow, Caledonian-road; Colonel Thomlinson Temperance Institute, institute and club premises, Waldon-street and Houghton-street.

WEST WESTMORLAND.—The R.D.C. is to obtain tenders for work at the sewage works.

WESTON-S.-MARE.—The M.H. has held an inquiry relative to the application of the U.D.C. to borrow £1,700 for the purpose of constructing a reinforced concrete model pond on the foreshore.

WHICKHAM.—The U.D.C. have approved of plans submitted by Messrs. John Bowes & Partners, Ltd., for the erection of 65 houses at Marley Hill.

WHITLEY.—In connection with the Whitley Upper and Flockton Joint Councils' decision to instal new pumps and to build a new reservoir for the joint water-works, it was decided to make application to the Public Works Loan Board for the borrowing of £1,100. Mr. F. Massie, of Wakefield, is to carry out the scheme.

WILLESDEN.—Plans passed by U.D.C.: Five houses, Holland-road, Harlesden, by Messrs. Done, Hunter & Co., for Mr. R. J. Curner; four houses, Oxgate-gardens, Cricklewood, for Mr. F. W. Brealy; six houses, Mount Pleasant-road, Brondesbury, by Mr. G. A. Sexton, for Mr. A. E. Williams; two houses, Mount Pleasant-road, Brondesbury, for Mr. C. W. B. Simmonds; 10 houses, North-way, Neasden, for Mr. S. Moss; two cooling towers, Acton-lane, Harlesden, for the Metropolitan Electric Supply Co., Ltd.; 48 houses, Ellesmere-road, Dudden-hill, for Messrs. Pearce & Taylor.

WILLINGTON (DURHAM).—Messrs. Straker & Love, owners of the Brancepeth Colliery, have presented a site in the new part of Willington, near the Urban Council's new houses, in connection with a welfare scheme, the total cost of which is £18,000.

WINDLESHAM.—The Council school is to be improved by the E.C. at a cost of £1,350.

WOKING.—The Surrey E.C. has approved a scheme for the adaptation of one of the recently purchased huts as a dining room and assembly hall, for the County School for Girls, at an estimated cost of £415. The B.E. has approved the proposal to provide a caretaker's cottage at a cost not exceeding £500, and the plans are in course of preparation.

WOLVERLEY.—In connection with Sebright's endowed schools, the B.E. is being pressed to form a new scheme under which a new school can be built.

WORCESTER.—The City Council has decided to widen Northwick-road, at an estimated cost of £2,705. Application for sanction to borrow this amount is being made to the M.H.

FIRES.

HENLLAN (CARD.).—Damage estimated at £12,000 was done by a fire which destroyed the Henllan Woollen Factory, owned by Alderman John Lewis.

LONDON.—Damage amounting to many thousands of pounds has been caused by fire at a large four-floored building in Fitzroy-court, Euston-road, used as a packing department by Messrs. Ewart & Son, Ltd., geyser manufacturers.

PORTHCAWL (GLAM.).—The Casino Cinema has been gutted by fire. The damage is estimated at £35,000.

BUILDING SURVEYORS' ASSOCIATION

A MEETING of this Association was held at the Auctioneers' and Estate Agents' Institute, Manchester, recently.

The subject of an examination for building surveyors occupied some considerable time. A report of the executive committee showed that considerable progress had been made with the R.I.B.A., with a view to setting up the Institute's Examination for provincial building surveyors, with one or two slight amendments thereto. The amendments recommended referred mainly to the more modern type of construction and the practices peculiar to provincial areas. The recommendations will be sent forward to the R.I.B.A. for their approval, when it is hoped that a complete scheme for a recognised examination will be set up, in which case all applicants for membership after a date to be subsequently fixed will be required to hold a certificate or diploma of the R.I.B.A. Important developments were approved relating to the revision of rules, which now include the admission of honorary members, who will be drawn from technical experts or professional men interested in the work of the Association. Provision is now made for retired members to continue their membership on payments of 50 per cent. of their retiring membership fee. Provision is also embodied in the new rules for the election of a president and vice-presidents. The following were subsequently elected as honorary members of the Association: Mr. James Wilding, Surveyor and Engineer to the Runcorn M.D. Council; and Mr. F. O. Creswell, Liverpool.

After a full three years' work, the Association has now made what is hoped to be progressive changes in the personnel of its officers. The retiring Chairman (Mr. W. J. Stone, Bootle), was unanimously elected President for 1924-5. It was pointed out by him that building surveyors outside the Metropolitan area, up to three years ago, had no organisation of any kind, and that it would require continued efforts, with a sound educational policy, and an examination scheme, to bring the Association to such a degree of efficiency that would enable it to bring pressure upon local authorities. Mr. Stone then nominated Mr. Walter Percival (Stoke-on-Trent), as Chairman for the coming year, which was carried unanimously. The retiring Secretary (Mr. W. A. Warwick) was unanimously elected to be Vice-Chairman, and will continue his work of Treasurer to the Association. Mr. Walter Rodgers (of Stoke-on-Trent) was elected Secretary, and Mr. Morris Crossland (of Leeds) appointed Organising and Press Secretary. In addition to the principal officers, the committee is representative of the following areas: London, Manchester, Liverpool, Cheshire, and Leeds.

NEW BUILDINGS IN LONDON

Pimlico.—ALTERATIONS.—Extensive alterations are being made to the Metropolitan Police station at Gerald-road. Mr. G. Mackenzie Trench, A.R.I.B.A., is the architect for the work. Messrs. Lole & Co., of Trafalgar-square, S.W.3 are the builders. The price of the work is £8,219.

Tothill-street.—ALTERATIONS.—The work now being done at "Imperial House," Tothill-street, consists of extensive alterations to the internal planning, new electric passenger lift installation, re-arrangement of sanitary appliances, fitting up testing laboratories, and redecorations throughout. The premises are to be occupied by the Associated Portland Cement Manufacturers. The work is being carried out under the instructions of the architects, Messrs. Henry Tanner. The sub-contractors are:—Lift installation, Messrs. Waygood-Otis, Ltd.; general building work, woodwork, sanitary installation and drainage, decorations and plaster work are being carried out by Messrs. Holland & Hannen & Cubitts, Ltd., of 258, Gray's Inn-road, W.C.1.

THE BUILDER

A JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

OL. CXXVII.—No. 4219. JULY 11, 1924.

THE INSTITUTE AND OXFORD

THE recent Council election of the Royal Institute of British Architects gave such a decided verdict in favour of the policy of the Council of amalgamation with the Society of Architects in agreement with the Council of that body that the referendum which opponents of he Institute policy asked for and which was agreed to at the ecent special meeting of the Institute at Caxton Hall, seemed o promise nothing more than a confirmation of the vote given t the election, except, of course, the agreement between the wo parties within the Institute—*i.e.*, Defence League and the Emergency Committee—which was made a condition of the roposed referendum. Following the three-to-one majority vhich the election gave in favour of the Council's policy, a ostal vote so soon after the election did not appear to be ecessary as a means of ascertaining the mind of the electorate, ut as a means of putting an end to party politics and elec- ioneering within the Institute, and the interminable arguments vith which we are all too familiar, we welcomed the proposal, nd the special meeting at Caxton Hall appeared to welcome t in much the same spirit. We had never any doubt that the ote given at the election after an exhaustive discussion of the nstitute proposals really expressed the opinion and wishes of he members to bring about if possible an amalgamation of the nstitute and the Society, with the further object of going to arliament as a united profession with a Bill for the statutory egistration of architects. The result of the referendum, herefore, does not surprise us; it does no more than confirm previous decision and should, as we believe it will, put an end o a controversy which was harmful to the prestige of both the nstitute and the profession. An opportunity is now afforded or all reasonable men to work together for the common good f the profession and of going forward with a practical policy n which a substantial majority of the profession are at one, nd from which we can hope for really useful results within reasonable period. The idea of registration undoubtedly nakes a strong appeal to many members of the profession, and rom the protection which they believe it will afford they see cure for many of the difficulties and hardships which confront hem in their daily practice. Whether they are right or wrong ve do not know, nor do we know what the fate will be of any Bill for their protection against unfair competition which may e presented to Parliament; but we can surely believe that never before has there been so good a chance as there is to-day f such a measure succeeding—or rather, as there will be if the olicy of the Institute is confirmed by the Society of Architects, as ve believe it will be, and is finally endorsed by the Privy Council. Whatever the fate of the Registration movement, ts advocacy on principle being now the policy of the Institute, here is apparently no longer any reason for the existence of society which was formed forty years ago to secure what at hat time the Institute was opposed to, and with the amalgama- ion of the two bodies we shall at last obtain a supreme Institute epresenting a great and united profession. Is that not in tself a result to be desired: an end to a long and weary con- roversy which justifies the means?

We do not know whether the annual conference of the R.I.B.A. has been accidentally or designedly delayed this year, but that it follows not only the annual elections but the postal vote is a happy fact, for the Oxford conference which should be held in an atmosphere of good will is the first general meeting of architects—for, of course, invitations have been extended to all the Societies, including the Society of Architects—since the amalgamation proposals were agreed to by the Institute, and the conference will represent if not *de jure* then *de facto* a united profession. No more suitable city for such a meeting could have been selected, for here in this ancient city of learning we find some of the best examples of our art of past and present times, and we find learning and art flourishing by the side of commerce and industry. Oxford is not a dead city, for its long history and tradition are carried forward with a progressive vitality which is essential in a modern city whether of learning or commerce, but it is not the actual survival of the ancient town or its mediæval charm and its picturesqueness which make it such a wonderful city; it is also, as Mr. Stirling Taylor points out in his admirable little work on Oxford,* the mental survival of a great social idea in mediæval life. "The University is the still living body of a great human institution which was a dominant factor of the Middle Ages. England, like Europe in general, has passed on into a modern world, but nowhere quite so completely as in Oxford has one large fragment of the mediæval life continued as a still breathing reality. . . Oxford University to this moment carries on that work of an educational guild which made it one of the most famous cities of the Middle Ages. The mediæval period was the age of guilds; and the guilds were perhaps its most characteristic social features. To this day Merton College and the others of its kind are performing on the very same spot, in the very same buildings often, the work which was allotted to them by their first founders." And it is in this city that architects are meeting this week shortly after the Council election and referendum; and now that our political differences are composed and our policy settled and we are on the threshold of a step which cannot fail to add to the responsibilities and duties of our Institute—as well as, we may hope, to its prestige and influence—we may remind ourselves while in this ancient city which devoted itself to "the care of the mind and the soul" that while architecture is an art it ranks among the learned professions. In our efforts, therefore, to secure protection against the unqualified practitioner we must not forget the obligations imposed upon us as members of a learned profession which is at the same time a science and a business. In the Middle Ages a city could devote itself to a life of thought, and though we cannot achieve anything under our modern social system comparable with the dominant characteristic of Oxford, we can at least remember the spiritual aspect of our calling, which this conference at Oxford will surely do something to stimulate if we realise in some measure the idea which was the origin of such a city as Oxford, and which has remained paramount throughout its long history.

*Oxford; a Guide to its History and Buildings, with twenty-five illustrations and a map, by G. R. Stirling Taylor. London: Longmans Green & Co.

NOTES

The Referendum. THE result of the postal vote which the Caxton Hall special meeting of the R.I.B.A. agreed should be taken is a complete confirmation of the result of the recent Council election, and the fact that the proposals for the amalgamation with the Society of Architects have been endorsed by 1,712 members against 267 shows how very widespread is the desire for unification of the profession, especially as on a separate poll of the Licentiates of the Institute 886 voted for the proposals against 22. So far as the R.I.B.A. is concerned, all the necessary steps have been taken and it is clear that the Council's policy has a quiet unprecedented measure of support. The matter will now be submitted to the members of the Society of Architects, and if they approve of the proposals the necessary Petition will be submitted to the Privy Council. At the meeting of the Institute held on Monday for the purpose of confirming the resolutions passed at the meeting held on June 17, the only dissentient was Professor Beresford Pite, and even he expressed himself wholly in favour of unification, but not of registration. We know, of course, that while the profession as a whole believe in registration as a protection against unfair competition, there are well-known and highly-respected architects who do not; but cannot the artistic liberty which they desire be secured under Registration?

The Society of Architects and the Proposals. AN extraordinary general meeting of the Society of Architects will be held at King George's Hall, Caroline-street, Tottenham Court-road, W.C.1, on Thursday, the 24th inst., at three o'clock in the afternoon, for the purpose of considering, and, if thought fit, passing the subjoined Resolution, viz.:—"That this Meeting hereby approves, ratifies and confirms the Provisional Agreement for Amalgamation dated the 29th day of May, 1924, and made betewen the Royal Institute of British Architects of the one part, and the Society of the other part, and hereby directs the Council of the Society to carry such Agreement into effect either with or without modification." Should the above resolution be passed by the requisite majority it will be submitted for confirmation as a special resolution to a second extraordinary general meeting, and such meeting will be held on Friday, August 8th, at the Registered Office of the Society, 28, Bedford-square, London, W.C.1. We have no doubt the resolution will be agreed to and if it is both parties to the proposals—*i.e.*, the R.I.B.A. and the Society—will have reason to congratulate themselves on a result which they believe to be in the best interests of the profession. The members of the Society may be reminded that the new class of Licentiateship in the R.I.B.A. must not be confused with the old one. The new Licentiate class is to be raised to the status of corporate membership sharing equally with Fellows and Associates the rights and privileges of voting powers on all subjects, the use of the designation "Chartered Architect," and the opportunity of proceeding to the Fellowship of the R.I.B.A. when qualified to do so. It is therefore obvious that members of the Society who are transferred to corporate membership of the R.I.B.A. will not only obtain the privileges of such membership, but will also gain the enhanced prestige and professional status which corporate membership in a Chartered body confers upon the holders.

The Building Trade Dispute. WE must all regret that the absence of a proper understanding between the employers and operatives has led to such an unfortunate dispute, the merits of which, with charge and counter charge made by the two sides, it is not easy to ascertain. The strike is not by any means complete, and employers in various parts of the country appear to be engaging men at the increased wage of one halfpenny per hour demanded. In Liverpool, according to Mr. Barron, speaking on behalf of the operatives, out of 2,000 bricklayers and masons who came out on strike there are no more than 158 out of work. The same speaker is reported to have said, "It is due to the bad organisation of the Liverpool employers that they do not employ one-half, possibly one-quarter, of the available labour in Liverpool. Out of 5,000 joiners in Liverpool, there are only 400 on strike. The one way to settle the difficulty is for the employers to grade the wages consonant with the economic condition of the industry. That would have raised the whole of the Liverpool rate and there would have been no trouble at all." Mr. B. B. Moss, however, speaking on behalf of the Liverpool Building Trade Association, stated that "The Liverpool Employers' Federation is one that embraces 90 per cent. of the employers and is one of the best organised in the country. There has, however, been a large amount of speculative building in Liverpool by men who are not really builders, but are merely dabbling in the building trade." Though we deplore the strike, we are glad the Court of Inquiry is presided over by Lord Buckmaster, who has already shown a determination to deal impartially with the situation and the evidence, and from whom we should have a helpful report, especially

Oxford: The High.

Oxford : Old Clarendon Press and Sheldonian.

if cognisance is taken of the statements which we give on p. 65, made by Mr. Nicholls on output and cost.

Strikes and What they Settle.

"Strikes settle the justice of nothing; they only decide how long one side or the other is prepared to suffer. If you have a conference at the end of a strike or lock-out, one party declares it is being crushed by the other." These sensible remarks were made by Lord Buckmaster, the President of the Court of Inquiry set up by the Minister of Labour to inquire into the dispute between the employers and operatives in the building industry, and we believe his opinions are shared by the public at large, as they certainly are by those directly affected by the dispute. And these were not the only sensible observations the President made, as was shown by his surprise at the delay in arranging a meeting between the Liverpool employers and operatives, which might have prevented either strike or lock-out. When told that a meeting had been held, he asked why there had been so much delay and why a meeting was not arranged at the beginning, as with Liverpool "settled the whole thing would be settled?" The Inquiry was concluded on Tuesday with the expectation that an informal conference will be arranged at once for a discussion between all parties. A report of the proceedings appears on pp. 64–65.

Oxford and Burford.

Architects in their enthusiastic enjoyment of the charms of the manifold and artistically varied periods represented by the buildings in this University are naturally apt to overlook the fact that many of the ordinary undergraduates moving about among the colleges entirely fail to recognise their architectural beauties. Colonel de Sales la Terriére, as an old student, tells us in his just published book, "Days that Are Gone," that in his day they all went in and out and round about taking little notice, if any, of their environments. The author, in after life, abundantly made good and evinced a sufficient recognition of the value of historic buildings by purchasing Burford Priory, when he enjoyed the fascinating enterprise of renovating its denuded walls after a century of disuse and decay. His achievement received, he says, "nothing but kind words from critics, both professional and amateur. But I had always a lurking sense that the whole place was a fraud and that I perpetuated a fraud in restoring it." The last of the Lenthalls had practically pulled down the whole original house, except the chapel and drawing room wing and south side, rebuilding a smaller house with the old stones, so that this so-called fine specimen of the Renaissance architecture of Oxfordshire was mostly only one hundred years old, dating from about 1808. When sketching Burford Priory many years ago we duly noted at the time how some of the stone bay moulded work had actually been nailed on and one length of this was suspended in mid-air from an iron pin. The fame of Col. de Sales la Terriére's restoration brought to Burford callers and "societies" of all kinds and descriptions. The Architectural Association on two different occasions made excursions to Burford, one of the most delightful villages in that part of England and well within reach of Oxford.

Housing Proposals.

We give on page 63 a memorandum of the Housing (Financial Provisions) Bill now before Parliament, which has been issued by a committee of the National Federation of House Builders. The memorandum indicates points on which the Bill in their opinion fails to carry out the expressed intentions of the Government and which in consequence will do "irreparable injury to the housing conditions of the country if it becomes law in its present form," and they also put forward suggestions as principles which should be enforced "if it is hoped to secure the most rapid production of houses from all available sources and if the State-aided housing is not to destroy all private enterprise in the great business of housing the people." The object of these suggestions is to render it possible for private capital to be attracted to housing and for investors to return to housing as a favourite investment. Any suggestions with this object deserve careful consideration.

Oxford : A Distant View.

GENERAL NEWS

Professional Announcement.

Messrs. Gething & Rolley, A.R.I.B.A., have purchased the business of the late Mr C. A. Downton, architect and surveyor, of Coventry-street, Kidderminster, and will carry on the practice at their office, Kingsley Hall.

Change of Address.

Messrs. Falconer, M.S.A., Baker & Campbell, of Gloucestershire, have removed their London office to 27, Soho-square. The telephone number remains unchanged.

Mr. Frank Windsor has removed to 1, Station-approach, East Croydon.

R.I.B.A.

The International Congress of Architectural Education will take place in London, from July 28—August 2. Headquarters: 9, Conduit-street.

Builders' Charitable Institution.

The new almshouse of the Builders' Charitable Institution, at Hounslow, was formally opened recently by the Lord Mayor, who was accompanied by the Lady Mayoress and the Sheriffs.

Cardiff School of Architecture.

The following awards have been made as a result of the sessional examinations at the School of Architecture at the Technical College, Cardiff. Mr. Paul Waterhouse, Past President of the R.I.B.A., was the External Examiner:—

Fourth Examination: L. Monroe, W. O. Oakley, B. W. Thomas.

Third Examination for the Certificate awarded at the end of the three years' full-time day course, exempting from the R.I.B.A. Intermediate Examination: V. Banks (with distinction), J. B. Wride (with distinction), H. A. Barton, E. Byrd, F. Harper.

First Examination: P. G. Budgen, J. T. Banks.

Royal Archaeological Summer Meeting.

The following programme has been arranged in connection with the forthcoming Summer Meeting at Winchester, from July 16-23.

Wednesday, July 16.—Cathedral and Monastic Buildings. Deanery. Evening Meeting.

Thursday, July 17.—Motor to Longstock Entrenched Dock. Danebury Camp. Mottisfont Priory. Romsey Abbey. Mayoral Reception.

Friday, July 18.—St. Catherine's Hill. St. Cross. Winchester College. Wolvesey Castle. Annual General Meeting.

Saturday, July 19.—Motor to Merdon Castle. Beaulieu Abbey.

Monday, July 21.—Motor to Portchester Church and Castle. Titchfield. Bishop's Waltham Palace and Church. Evening Meeting.

Tuesday, July 22.—Motor to Old Basing. Monk Sherborne. Sherborne St. John, The Vyne. Evening Meeting.

Wednesday, July 23.—Hyde Abbey Gate. West Gate. Winchester Castle. Museum. St. John's Church. St. Peter's Church.

Royal Society of Arts.

The Council has awarded the Society's Silver Medals to the authors of the following papers read before the Society during the past session:

Papers read at the Ordinary Meetings: Sir Frank Baines, "The Preservation of Ancient Monuments and Buildings"; Sir Richard A. S. Paget, Bart., "The History, Development and Commercial Uses of Fused Silica"; Major-Gen. Sir Fabian Ware, "Building and Decoration of the War Cemeteries"; Frank Hope-Jones, "The Free Pendulum"; Brig.-Gen. Sir Henry Maybury, "The Victoria Dock District and its Roads"; T. Thorne Baker, "Photography in Industry, Science and Medicine"; Mrs. Arthur McGrath (Rosita Forbes), "The Position of the Arabs in Art and Literature."

Papers read in the Indian Section: Brig.-Gen. H. A. Young, "The Indian Ordnance Factories and Indian Industries"; Sir Richard M. Dane, "Manufacture of Salt in India."

Papers read in the Dominions and Colonies Section: C. Gilbert Cullis, "A Sketch of the Geology and Mineral Resources of Cyprus"; The Right Hon. Sir Frederick Lugard, "The Mandate System and the British Mandates."

The National Gallery.

Twelve pictures from the collection of Mr. Henry Wagner have recently been placed on view in the east vestibule of the National Gallery, on each side of the door leading into the Spanish rooms. Of the five pictures to the left of the door, one is a characteristic specimen of Adam Elsheimer, representing the "Baptism of Christ." The other four are Flemish works of about the year 1500. Three so far remain anonymous; the fourth, an "Ecco Homo," has been recognised for some time as a work by Jan Mostaert. The seven Italian pictures include a very early painting of "The Dead Christ," Venetian work of the fourteenth century, still covered with a sheet of very early hand-made glass; a powerful "Noli me Tangere," by Jacopo di Cione, a somewhat injured "Pieta," by Ambrogio Lorenzetti, and examples of Tommaso da Modena and Bartolo di Fredi. With them must be mentioned a "S. Paul," apparently from the famous studio of Verrocchio, and a picturesque "Salver," also painted in Florence, c. 1450, by the so-called "Cassone Master." On its face the Salver represents "The Triumph of Love," on the other side are the Arms of the Strozzi family. These make a valuable addition to the small nucleus of works by the Italians which the Gallery already contains.

COMPETITION NEWS

Scottish Rugby Union Stand.

The adjudicators have made the following awards in this competition:—(1) Equal: Messrs. Redpath, Brown & Co., Ltd., Edinburgh, and Mr. R. S. Sherar, Edinburgh; (2) Mr. J. A. Orrell, Manchester; (3) Mr. W. Forgan, Edinburgh. The contract for steel has been placed with Messrs. Redpath, and premiums have been awarded to Messrs. Sherar, Orrell, and Forgan respectively.

Public Baths, Newton-in-Makerfield.

Designs are invited for the erection of Public Baths at Newton-in-Makerfield. Premiums of £150, £50 and £25 are offered respectively. Applications for conditions to the Clerk to the Council not later than July 25.

Barton-upon-Irwell Hospital.

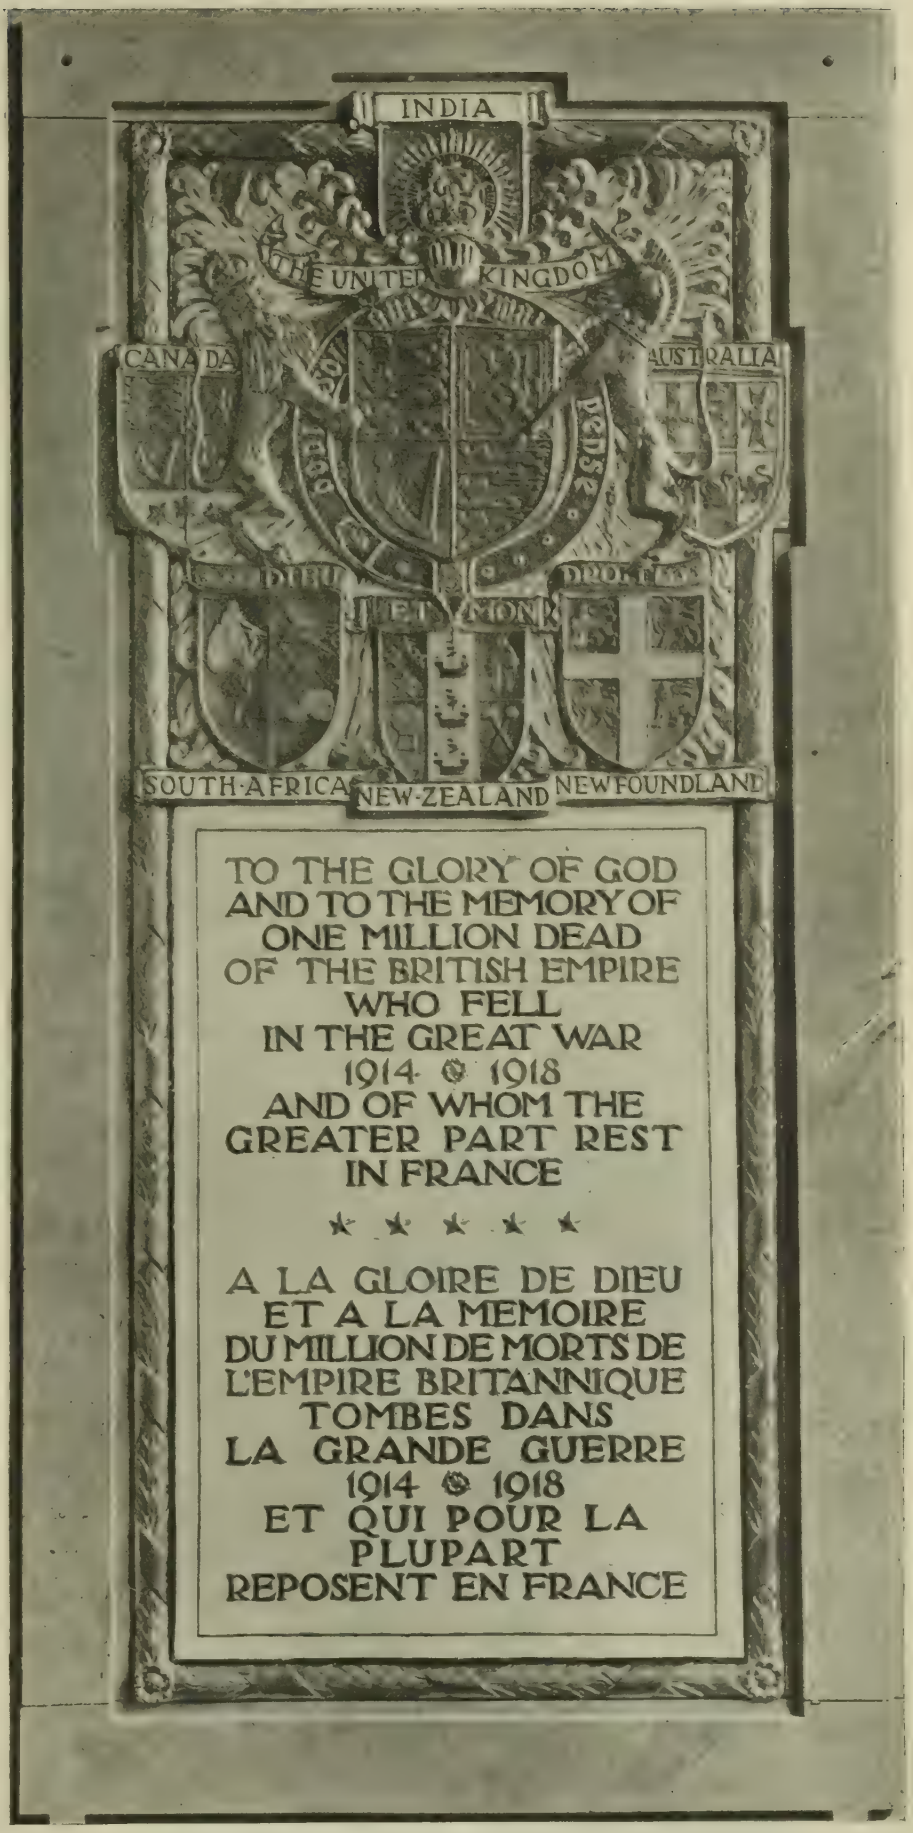
The sending-in date for this competition is July 31.

Other Competitions.

Other competitions still open include the following (the dates given are, first the sending in date, and second the issue of *The Builder* in which full particulars were given):—Ross-Smith Memorial (Sept. 30; Feb. 21). Harrogate Infirmary (Sept. 30; May 30). Hamilton War Memorial (Sept. 1; May 30). Glasgow High School Memorial (Sept. 30; June 13). Masonic Memorial (Aug. 22; June 13. Bexhill Entertainment Hall (Sept. 1; May 30).

Letters on the Building Trade Dispute we give on p. 61.

Oxford: St. John's College.



EXHIBITION NOTES

DRAWINGS OF WORKS BY SIR CHARLES BARRY AND JAMES BROOKS.

This summer's gathering of geometrical details and perspective, on view during the early half of July, at the Royal Institute of British Architects, Conduit-street, naturally attracted no little attention at the special meeting of members, on the 7th inst. The assemblage of these typical drawings may properly be described as not only historically informing, but because they furnish an essentially striking contrast to the current kind of contemporary draughtsmanship. The collection, though restricted to comparatively few exhibits, afforded many practical suggestions, chiefly perhaps by reason of the fundamental thoroughness thus displayed. The subjects chosen comprised some of the eminently successful buildings of two of the most capable and representative architects of the nineteenth century. No lengthy description of either Sir Charles Barry's Houses of Parliament, or James Brooks' well-designed brick churches is here needed. Everyone familiar with the Victorian Gothic revival is well acquainted with both these masters of Mediæval ideals and accomplished productions. The refined and delicately executed working drawings of Westminster Palace are beyond all praise. The buildings, commenced in 1839, were carried out from the plans of Sir Charles Barry (1795-1860) during the 'forties. The exquisite thoroughness of the several sections and elevations shown is rightly attributed to Welby Pugin (1812-1852), the joint architect with Barry, assisted by Talbot Bury (1811-1887), Benjamin Ferry (1810-1880), and others, who, no doubt, were engaged in delineating, with such fine lines, these wonderful details set out to so small a scale. Such performances of skill and patience supply an "eye-opener" to those who, in these days affecting a slipshod style, are seemingly advised by their teachers to cultivate a less workmanlike method, being content with roughly knocked off office drawings supposed to be up to date and stylish. The same care on the part of the draughtsmen employed by Barry and Pugin is exemplified by the selection of a later period in the century, but earlier Gothic style, of James Brooks (1826-1901). He was elected Royal Gold Medallist in 1895, and is here chiefly represented by his excellent design submitted in the first competition for Liverpool Cathedral, including the general drawings and several capable pen-and-ink perspectives by F. G. Knight, who formerly was with G. E. Street, R.A. Only a few of Brooks' East-End of London churches are included in this show. St. Chad's, Haggerston, is represented by an interior drawn by Mr. Maurice B. Adams, who was often employed by Brooks. Other churches are seen by sketches prepared by Brangwyn and F. C. Knight.

IMPERIAL MEMORIAL TABLET.

This memorial tablet to the memory of the million dead who fell in the Great War, which was unveiled by the Prince of Wales on Monday, was modelled in gesso relief by the artist, and is richly gilded and coloured, with the heraldic devices of the various Dominions surrounding the Arms of the United Kingdom, and with inscription below. The Arms of India are seen at the head of the Tablet, above the Royal Arms, with the motto: "Heaven's light our guide," and include the Star of India with the sun's rays behind. The arms of Canada, Australia, South Africa, New Zealand, Newfoundland, including all the varying devices of the quarterings, give variety of form and colour to the whole. The tablet is surrounded by a leaf and ribbon border, gilded and coloured. The dimensions of the tablet are 3 ft. by 6 ft. The Hopton wood frame was executed by Mr. W. Tomes, The Grove, Hammersmith.

Imperial Memorial Tablet for Notre Dame Cathedral, Paris.
Executed by Mr. Reginald Hallward.
(Col. H. P. Cart de Lafontaine, F.R.I.B.A., Architect.)

ROYAL INSTITUTE OF BRITISH ARCHITECTS

Amalgamation Approved.

A SPECIAL general meeting of the Royal Institute of British Architects was held at the rooms of the Institute on Monday to announce the result of the postcard referendum decided upon at the meeting held on June 17 and to confirm the resolutions passed at that meeting. The President, Mr. J. A. Gotch, presided.

The Hon. Secretary announced the result of the poll as follows:—

In favour of the Council's proposals	1,712
Against	267
Majority for	1,445

Five unsigned postcards were not allowed.

Mr. Gotch then formally moved the resolutions.

Professor Beresford Pite said he would make comment on one point only: that he was wholly in favour of unification, but it semed to him that the inclusion in the agreement of Clause 6 [When and so soon as this Agreement shall have become absolute the Royal Institute shall forthwith promote and use its utmost endeavours to carry through a Registration Bill until it becomes the Act of Parliament, and for this purpose forthwith, and before the Society goes into liquidation, to appoint a Registration Committee. The Society shall have the right to nominate one-half of the members of such committee] would defeat the very purpose at which they were aiming—the unification of the profession. The agreement proceeded on a statement in the preamble which read that "there are no longer any serious differences of opinion among architects with regard to registration." He ventured to suggest—he only suggested it in justification of his own objection—that that was not true; that there were still serious differences of opinion on the subject of registration. Those differences might be trivial. He represented them within the Institute.

They must remember that outside the Institute and the Society of Architects there were a large number of important men who ought to be included in any scheme of unification. There had always been certain men whose feelings had been rather averse to the organisation of the profession, and those men could never be disregarded. It had always been so in the history of the Institute. Thirty years ago the most distinguished architects in the profession were outside the Institute. They had not the document before them, but a most impressive memorial on the subject was presented in 1891 to the Institute. He would not go back to that, but the spirit which always attracted the artist to liberty was still in existence and was still active. The Institute could not shut its eyes to the fact that there was a body of very influential opinion which met to discuss architectural problems—the Art Workers' Guild—and of which they had taken no account at all. If they wanted to take account of them they would find that nearly all were strongly opposed to registration. The statement in the preamble was not the fact and they had better delete it. They would get unification if they did not tie it up with that which was bound to secure disunion and discord—registration.

Every effort to make the profession a close profession, to tie up the art of architecture to those who were registered by that Institute, was a false position for them to take up. He would endeavour to present that view when the time came. It would be interesting for the members of the Institute to look up their own records on the subject. They would find that in 1904 Sir Aston Webb expressed his deep repugnance to the idea. It would be wrong to rely on Sir Aston Webb's quoted opinion in his absence; but in 1904 Sir Aston said that the idea was repugnant to every artist. He would vote for every clause except Clause 6.

Major Corlette stated that they had met that afternoon only for the purpose of passing the resolutions *en bloc* or rejecting the entire scheme.

The resolutions were then put to the meeting and carried practically unanimously. A vote of thanks was then passed to the President, Mr. J. A. Gotch, and the proceedings terminated.

Oxford: Old Grammar Hall, Magdalen College.

Oxford: The Canterbury Quadrangle, St. John's.

WE take the following notes from the Minutes of the Council meeting held on June 23:—

ARCHITECTS AND BUILDERS.—The Practice Standing Committee was authorised to arrange for periodical meetings of an informal character between representative architects and builders to discuss matters of interest to both.

THE GLAZING OF WINDOWS IN ANCIENT BUILDINGS.—The Art Standing Committee was authorised to appoint two members to represent the R.I.B.A. at a conference summmoned by the Society for the Protection of Ancient Buildings to discuss the glazing of windows in ancient buildings, particularly with regard to the following points:—(1) The repair and protection of ancient glass; (2) to discuss and attempt to arrive at some general conclusion with regard to putting new stained glass into old windows.

THE BRITISH SCHOOL AT ROME.—Sir John Simpson, K.B.E., was re-appointed to represent the R.I.B.A. for a further period of three years on the Council of the British School at Rome.

DURATION OF SESSION.—Under the provisions of By-law 56 it was resolved that the session 1923–1924 be prolonged from June 30 until November 2.

ROYAL COMMISSION ON FIRE BRIGADES AND FIRE PREVENTION.—It was decided to notify the Home Office that the R.I.B.A. and its allied societies are in general agreement with the recommendations of the Royal Commission on Fire Brigades and Fire Prevention.

PROFESSIONAL CONDUCT.—Two members were censured for professional advertisement by means of circulars.

Cologne Cathedral Danger.

It is stated that certain parts of Cologne Cathedral are in danger of collapsing. It is also stated the cathedral has suffered severely from the recent weather. The cathedral architect has refused to be responsible for the building any longer. Cologne Cathedral stands on the site of a cathedral which was finished in 873 and later ruined by the Normans. Fire destroyed what remained of it in 1248. The present cathedral was begun a few years later, but was not completed until 1880.

OXFORD: AN IMPRESSION

By A. E. RICHARDSON.

It is usual in recording a description of Oxford to allow the ink to flow in opposition to the claims of other centres of learning. Hence it has happened that most authorities start off with high words and fulsome praise in order to establish an argument which a little reflection proves to be purely arbitrary.

Most people visiting a University accept the concrete impressions of collegiate life at face value and imagine the foundation to have taken place at a definite date, which can be looked up in guide books. Such unsophisticated views are wide of the issue, for it is a fact that neither Oxford nor Cambridge can name a founder; neither is it possible to state precisely when the colleges began to be used. In the development of communal centres, geography plays a dominant part, hence it was that the ford across the Thames between Mercia and Wessex was selected as a point of defence, and in course of time came to be recorded in the Anglo-Saxon chronicles. From the Domesday Book we conjure up an idea of the resistance offered to the Normans, and from the remains of the fortified works erected by Robert D'Oili can imagine the reprisals that followed. Here at once is the secret of the city—it is monarchial and loyal, and so it continued from the time when the Empress Maud was besieged there until in the struggle between King and Parliament it became the chief rallying point for the Cavaliers.

Having thus dealt with the salient points of the city's right to be, the next procedure is to hint of the time in the twelfth century when Theobaldus Stampensis taught there and provided the beginnings of study which led to the system of organisation recognised in the thirteenth century and the European reputation of the University a century later. For the rest, the buildings themselves present the most accurate chronicle; the assemblage of stones having caught the spirit of the ages—something abstract and disinterested that proclaims pedagogy to be a thing of minor import, something spiritual and indefinable that defies analysis and upsets all dogma written and spoken regarding the sublime and beautiful. Oxford inspires a retrospective mood. Viewed from the high places, where tower, dome and pinnacle challenge the neighbouring hills, the *mise en scène* is airy and expansive. It is a city well knit with greenery that parts it into sections and then as unexpectedly binds the parts. There is no incongruity, nothing pre-arranged; even the tall smoke stacks of industry have stepped into place as though fearful of disturbing the peace. In the early morning, the features of the city's silhouette are sharply defined and clear cut, having all the vividity of some remarkable vision, something not of too ancient lineage, but in sparkle and resource savouring of magic. Oxford does not awaken like other cities, she takes her time, her people have a way of avoiding abruptness—in part a legacy of other days. Her dreams are of the restful kind, she does not indulge in matutinal greetings that rise to a roar when the morning is yet young. On the contrary, it is the uprising of a city conscious of previous labour. At high noon, Oxford assumes the middle-aged flecking of silver-grey, the shadows are stronger, the crows' feet deeper. It is then that the ghosts of her master masons point to pinnacle and dome, it is then that the stone reflects the quality of the Cotswolds and the umbrageous vegetation plays its part of light, shade, and contrast. Perhaps it is the colour of Oxford that pleases most; it is in effect so unlike other cities, so subtle, yet so poignant, of a masculinity profound, yet of a delicacy and breeding to which ostentation is unknown. Evening closes, the shadows lengthen, the buildings take on a velvety blackness, until points of light mark the nearer houses, and so, as the day fades, it recalls in its solemn droning the haunting ground of fireflies. Even when the clouds, heavy laden, burst upon the Cotswolds, Oxford never wears that hang-dog look one associates with some places in a downpour. She is well roofed, and then it is that spire, tower and dome appear to defy the elements by thrusting and shielding.

I would not, even if the space were afforded me, attempt to give the history of the buildings; it would, I must confess, be interesting to discuss them in detail, to tag on the dates and the names of the architects, but the present object is to revisit Oxford, to gain new impressions such as are common to the generality of visitors, to discard for the moment the architect's view point, and to place, however inadequately, all Oxford on paper.

In addition to her other attributes the hospitality of the city is proverbial, she has the gift of promoting allegiance both to authority and to herself, she has retained the trick from mediæval times to this present. Thus it is that town and gown have grown up side by side, and though in point of thought both may agree to differ, the conservation of local amenities invariably proves a rallying ground. So we find industry flourishing with learning, and, as a corollary, marmalade and motor cars in high demand. To be a native of Oxford is almost as good in the eyes of a townsman as to be entered at a College, such is the pride of locale. During the long vacation Oxford becomes an appendage of the United States, just as at this time she has become a temporary meeting place for architects. Our American friends have a tender affection for the Mitre, and although the day is past when telegrams were sent from Stratford-on-Avon ordering lunch and the keys of the Colleges, Americans are still under the idea that Oxford can be done in a few hours. We will not grudge them their hasty peregrinations; no doubt they can gather impressions more favourable to their own towns, but Oxford remains in England.

To an architect Oxford is an articulate city; it is as essential to his mind and hand as elementary training in his work. What impresses most is the extraordinary vivacity of the buildings, the variety of ideas, and the direct statement of conditions. One cannot pass the sentinal tower of Magdalen without forswearing all predetermined ideas of studying only one phase, and that a pet one, of English building. No casual sightseeing suffices if one desires to understand the secret of this mother of Universities. The older colleges and churches reveal the truth that mediæval builders were prolific in ideas and daring in the tasks they undertook; there is evidence of collective reasoning as of individual enterprise. The wonder is that so much forethought should have been given to endow the city with buildings which have served and will continue to serve even the exacting conditions of progress.

The mediæval interest is continued in the work of the Revivalists, it survives in the buildings by Butterfield and Bodley, as it does in King James's Gothic and the delicate detailing from the pencil of Sir Thomas Jackson. The Italian influence is evidenced in the work of Inigo Jones, and the compromise between mediæval and classic is seen in the work of Sir Christopher Wren. The later work of Gibbs and Dean Aldrich shows how taste responded to the Burlingtonian coterie. Finally, on the classic side there is the Taylorian with its curious tabled Ionic caps, which latter Cockerell researched as the work of Ictinus. The story of mediæval life, as well as of the seventeenth and eighteenth centuries, is set forth on every side. There are the oaken screens and wainscotings of the halls, the fantastic and sober balustrades, the odd quips and conceits of masons and carpenters, who could work an order in great with scarcely more than a woodcut to guide them. It is obvious, although it has not yet been shown, that Oxford while gathering the talent of the countryside within her walls for the purpose of her buildings, in turn sent out the influences of the completed buildings, for in no other way does it seem possible to explain the Cotswold tradition or the building of the fine houses of the late seventeenth and eighteenth centuries in the neighbouring towns and villages. Is it not to be inferred that masons who had been apprenticed to masters in Oxford, in turn found employment outside the walls? It is a pleasant conjecture and one that may have a substratum of truth. Of the minor features one may refer to Oxford windows, which range from the great ones at Oriel to the bays of St. John's and the generous sashed windows of the Georgian fronts. It is in Oxford that the sashed window with bars worked with square blocks in true masonry fashion can be discovered.

This impression, written during Congress week, covers many years of casual observation; it has been prepared from a non-debatable standpoint; it is unprejudiced regarding taste, style or fashion, and seems rather to record characteristics which are other than architectural. Who, for example, some years since would have dared to have been pleased with Tom-Tower or Keble Chapel, or who would have seen any merit in the spiky twins of All Souls; but it is irrefutable that fashion of a past day has a way in time of taking its place, and mellowed by the settlement of eld in turn becomes above criticism.

My impression began above the city; it ends with a memory of the stone bridges of Addison's Walk and the embrasures of Magdalen rising sheer above the water of Broad Walk, Christ Church, of many cool lawns and paved courts; it carries recollections of quadrangles and façades, which appear to have happened, of spires and towers which have an affinity, although for family reasons many times removed. I have recollections of fine shops in Cornmarket-street, of the pictorial flourish of the Municipal buildings, and the Indian Institute, as well as glimpses of ineffable charm on the river and backwaters. Here, then, is an index, it is a partical one, to the life of the nation. Cambridge demands a different key. Throughout the world men of all ranks have some idea of the University cities; perhaps the claim of Oxford is the stronger. In Canada, Australia, New Zealand, South Africa and India Oxford stands for the very soul of culture. What myriads have an interest in the place, and how few can say with truth that they understand the intuition that inspired the original builders, who for the most part were of the countryside.

Architectural Association of Ireland.

On and after June 30, the address of this Association will be 8, Merrion-square N. Dublin.

Radcliffe Library, Oxford.

OXFORD VIEWS

There is unique fascination in views of an ancient town from a lofty and central position, and in the case of Oxford, than which there can be few towns better worth seeing from such moderate elevations as her own buildings afford, the choice of the point of view generally and naturally falls upon the gallery around the dome of the Radcliffe Camera. This position possesses so many and such obvious advantages in centrality and ease of access that it is easy to overlook its one grave disadvantage, in affording no view of the Camera itself. Those who wish to consider this stately masterpiece of Gibbs, in relation to its Gothic and pseudo-Gothic setting, and to admire the congruous beauty of an incongruous group, must mount elsewhere.

The opportunity presented itself, a few weeks ago, by means of the scaffolding and stagings which then surrounded the Twin Towers of All Souls College, of securing such a view, with others of considerable interest; and we are able, by the permission of the Warden of All Souls, and through the kindness of Mr. Richard Axtell, of Messrs. Symm & Co., Contractors for the repairs, to offer our readers a series of views taken from this unusual point of vantage.

The views are in the following order :—

(1). Westward.

The Radcliffe Camera, seen over the "Great Quad" of All Souls, with Hawksmoor's arcaded screen, and its central cupola in the foreground, flanked by the College Chapel on the left, with the tower and spire of St. Mary's, the University Church, rising beyond and above the latter; further on, in the middle distance, is a part of the front of Brasenose College and its Chapel, and beyond, and in the centre of the view, the tower and spire of All Saints' Church.

(2). North-Westward.

The Northern side of All Souls Great Quad, which is the well-known Codrington Library. The great painted sundial over the central bay is said to have been devised by Wren, and was formerly on the south wall of the Chapel in the front or entrance quadrangle of the College, as may be seen in Loggan's view of 1675. Beyond appears the Bodleian Library, whose green copper roofs show between and above the battlements, and whose well-known square tower, "Of the Five Orders," presents its unadorned sides to the spectator.

(3) North-Eastward.

New College, the south-west external angle of the old Quadrangle, and the Warden's Lodgings seen over the Warden's garden and across the high stone walls of New College-lane. On the left is the ancient college Tithe Barn, and the stone staircase giving admission to the garden from the Lodgings, by the passage whose archway over the lane just shows to the right of the Barn, behind whose stone tiled roof are seen the old stable roofs, also stone tiled, and the beautiful little bell tower on the north side of the cloister garth. In the centre, and to the right, rise the upper portion and roofs of the Chapel and Hall, and the Muniment Tower. This view shows clearly the original form of the buildings of the mediæval Quadrangle; as the fourteenth-century west gable coping stands forward from the return wall of the subsequent additions, and these, which are in ashlar, having been recently refaced show white in the photograph.

(4). North-Eastward.

New College, view showing Bell Tower and Warden's Lodgings.

(5). Eastward.

The western side of Queen's College, a long, three-storeyed range, with the fine Library at the northern end, left-hand in view, and the cupola-crowned bell turret of the Chapel rising above the roofs. Beyond are Magdalen Tower, and the nearer turret of Sir Thomas Jackson's University Schools; in the extreme distance are the tree-topped heights of Headington, whose obsolete quarries have supplied so much bad stone to Oxford.

(6). South by West.

On the left the western portion of St. Mary's Nave and Aisles; beyond, in the distance, the Cathedral tower and spire and the towers and roofs of Christ Church. In the centre of the view St. Mary's Passage and its gabled houses, further to the right the east end of Brasenose Chapel and a portion of the College, beyond these Sir Thomas Jackson's new tower and roofs of Brasenose; and immediately behind the former, Wren's belfry, or "Tom Tower," over the entrance gateway of Christchurch.

(7). South-Westward.

Brasenose College. On the left the north end of the Hall, and beyond, the west range of Sir Thomas Jackson's buildings; beyond these All Saints' Church, the design of which is attributed to Dean Aldrich, whose marked architectural sense and abilities have left other evidences at Oxford.

R.I.B.A. EXAMINATIONS

Intermediate.

The Intermediate Examination, qualifying for registration as Student R.I.B.A., was held in London and Leeds from May 23–29. Of the 65 candidates who presented themselves, 26 passed and 39 were relegated. The successful candidates were as follows, the names being given in order of merit as placed by the examiners :—

W. J. Thrasher, Bristol.
W. G. Sinning, Beckenham.
H. T. Wykes, Wrexham.
F. C. Button, Folkestone.
H. J. Dicketts, Northfleet.
B. S. Tempest, Harrow.
G. S. Saunders, Leeds.
P. G. J. Carter, Caversham.
R. V. Walker, Woolwich.
F. L. J. Dolman, Putney Bridge-road.
T. W. Snailum, Wilts.
G. Garnett, Manchester
S. R. Driver, Headingley.
H. J. Reid, Leeds.
G. R. Acton, Worcester.
T. W. Applegarth, Teddington.
H. Brown, Blackpool.
F. Chippindale, Otley.
W. S. Corlett, Streatham Hill.
N. E. Davenport, Queen's Gate.
A. W. Glover, Manningham.
F. C. S. Harrison, Durham.
A. D. A. Haskins, Birmingham.
G. W. K. Pitter, Letchworth.
F. L. Randle, Smethwick.
S. E. Steward, Reading.

The Final and Special.

The Final and Special Examinations, qualifying for candidature as Associate R.I.B.A. were held in London from June 12–19. Of the 35 candidates admitted (six of whom took Part I only, and one Part II only, having elected, in accordance with the regulations, to take the Examination in two parts), 13 passed (two in Part I only) and the remaining 22 were relegated. The successful candidates are as follows :—

C. K. Bhedwar, Hampstead.
S. L. Blackburne, London.
J. P. Blake, Hounslow.
C. H. Brightiff, Cricklewood.
A. A. V. Campbell, Brunswick-square.
S. S. Careless, Northwood.
R. S. Cobb, Grove Park.
C. G. W. Eve, South Nutfield.
A. G. Geeson, Leicester.
E. Reily, Belfast.
J. M. Wilson, Baghdad.
G. M. Bhuta, Highbury New Park (passed in Part I only).
P. L. Sharma, Highbury New Park (passed in Part I only).

Drawings by Sir Charles Barry and James Brooks.

An exhibition of original perspective and working drawings of the architectural works of James Brooks, including his competition drawings of Liverpool Cathedral, and of the Houses of Parliament by Sir Charles Barry which have recently come into the possession of the Institute, will be on view in the Gallery of the R.I.B.A., 9, Conduit-street, from July 7 to 16, between the hours of 10 and 6 p.m. (Saturday, 1 p.m.).

ILLUSTRATIONS

Sir William Dunn School of Pathology, Oxford.

This illustration shows the drawing as exhibited at the Royal Academy. The building is for the University of Oxford, and will be situated upon the Parks' site adjoining South Parks-road. Messrs. Wooldridge & Simpson, of Oxford, have secured the general contract, and are about to commence the work.

Mr. E. P. Warren, F.S.A., F.R.I.B.A., is the architect.

Mediaeval Oxford.

The illustration of Mediæval Oxford which we give this week is from a drawing by the late H. W. Brewer, which was published in *The Builder* a good many years ago, together with an article by Brewer on the subject. The Oxford Conference of the Royal Institute of British Architects is an opportunity for giving this interesting impression of Oxford of the past, the value of which does not altogether depend on the complete accuracy of its presentment. A larger copy of the drawing and the descriptive article referred to above can be had on application at this office.

Oxford Views.

The Oxford views we give this week are taken from a point of view which is not often available, as we mention in a brief note of the views on p. 48.

Picture House, Oxford.

St. Edward's School Memorial, Oxford.

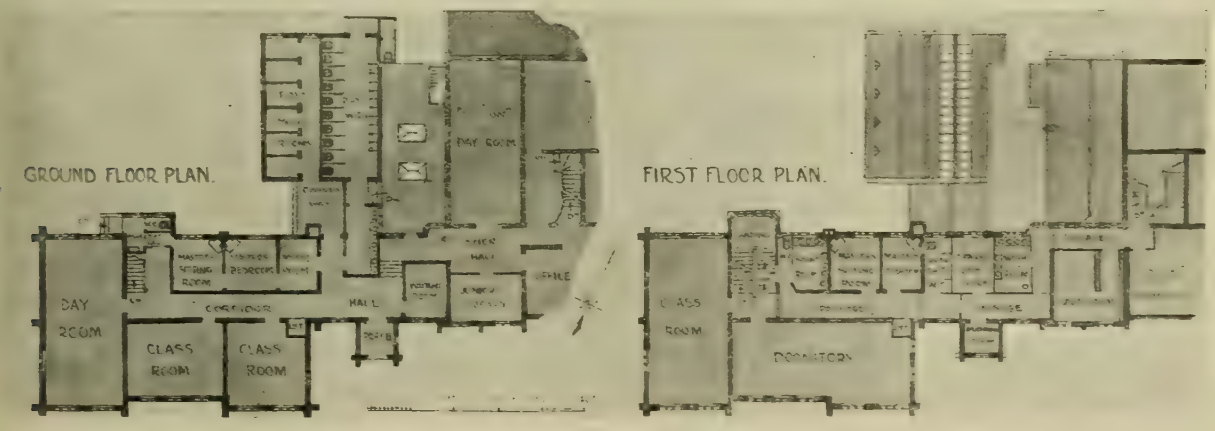
This building is the second instalment of the Memorial, the Calvary outside the Chapel having been dedicated in 1921. It adjoins the "New House" built in 1882 and continues the south side of the quadrangle for about 120 ft. The materials employed are sand-faced brick from Headington, with monks park stone for windows, parapets and weatherings.

There are two dormitories and a large day room (38 ft by 18 ft), with four sets of rooms for masters, and one for the matron, with linen and box rooms. There are also two class-rooms, a reading room and lecture room, the last two being 38 ft. by 18 ft.; and six music rooms are provided in a detached wing. Lavatories and washing rooms are provided on each of the four floors.

Messrs. Hinkins & Frewin, of Oxford, were contractors for the foundations (£1,055), and Messrs. Wooldridge & Simpson, of Oxford, for the main structure (£14,474), which has now reached wall-plate level.

The sub-contractors are:—Heating, Messrs. J. Jeffreys & Co., Ltd., London; electric lighting, Messrs. Hill, Upton & Co., Oxford; fireproof floors, Messrs. The Kleine Flooring Co., Holborn; staircase and ground flooring, Messrs. The Empire Stone Co.; steel casements, Mr. J. H. Pye, Moreton-in-Marsh; sanitary fittings, Messrs. The Leeds Fireclay Co., and Messrs. George Jennings, Ltd. The lift by Messrs. Medway, and the asphalte work by Messrs. Thomas Faldo & Co.

Mr. H. S. Rogers, F.S.A., of Oxford, is the architect. Quantities by Mr. E. R. Babbs, London.



The Oxford Picture House.

This cinema, recently finished, at Magdalen-street, Oxford, has been carried out by Messrs. Frank Matcham & Co., in conjunction with Mr. J. C. Leed, of Oxford. It has a seating capacity of 950 on the ground floor, and 350 in the balcony.

The main entrance is of marble surrounded by a bronze illuminated fascia. The vestibule, 50 ft. long and 15 ft. wide, has a mosaic and marble floor, and walls treated in stucco. The main lounge, 46 ft. by 30 ft., is treated in rich French Renaissance; stairs lead to the tea rooms above. The inner foyer has stairs to the balcony and also main entrances to the stalls. The auditorium consists of a ground floor and balcony. The centre feature in each main wall of the auditorium is a p inting 30 ft. long by 17 ft. high, one depicting "Modern Sport," and the other "Early Learning." These were painted by Mr. G. Rushton, R.B.A. The projector room, &c., is situated over the balcony. A plan is given on p. 60.

The following is the list of contractors who carried out the work:—

Structure: Messrs. Hinkins & Frewen, Oxford; electric lighting: Messrs. Grierson, Ltd., London; heating and ventilation: Messrs. Norris & Dutton, London; fibrous plaster and decoration: Messrs. F. De Jong & Co., London; plumbing: Messrs. Stitson, White & Co., London; marble and mosaic: Messrs. Fenning & Co., London; draperies, upholstery and seating: Messrs. Goodalls, Manchester, and Messrs. Lazarus, London; wrought iron balustrades and staircases: Messrs. Abercrombie & Son, London, and Mr. Arthur R. Maxted, London.

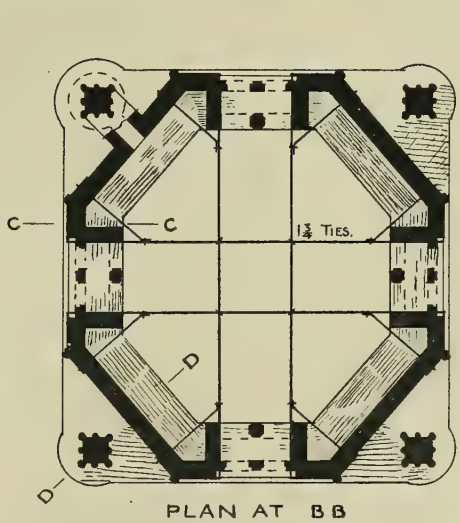
THE TOWERS AND SPIRES OF OXFORD

By SIDNEY TOY, F.S.A., A.R.I.B.A.

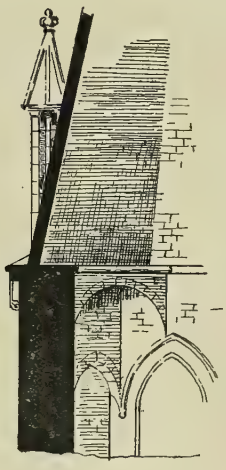
Oxford is happy in the possession of a great number of towers and spires of exceptional interest, both in respect to the historical periods they illustrate and to the boldness and virility of their construction. Practically every outstanding period of architectural development subsequent to the Norman Conquest is represented, from the towers of St. Michael's Church and of the Castle, both built shortly after the Conquest, to those of modern times. It is therefore necessary here to confine our attention to some of the most important of these structures. The tower of St. Michael's Church was probably built about 1071, but is a clear example of the survival of Saxon methods of construction. It has two tiers of belfry windows, each window being of two lights separated by a baluster shaft placed in mid-wall.



The tower of the Cathedral is built over the central crossing, and is of two distinct periods. The lower part, up to the first external string course, was built during the latter part of the twelfth century, and although it was clearly the intention of the builders to carry the tower to a much greater height, it must have remained as a low base, appearing just above the roof of the church, for some thirty years or more. The bell chamber and spire were added during the first part of the thirteenth century, and the whole of this work is carried out in the style of that period. The early part of the tower is of two stages. The first stage over the four arches of the crossing, two of which are round and two pointed, forms a low gallery open to the interior on each side by a central arcade of narrow arches. The second stage, the lantern proper, is decorated by lofty wall arcades on all sides, the extreme bays of which are pierced by round-headed windows. Each angle is buttressed externally by a large circular turret. As will be seen from the drawing, Fig. 2, the windows of the lantern flank the sides of the early roofs of the church, the weathered courses of which still remain on the external faces of the walls. The tower is oblong in plan, being nearly two feet wider from north to south than from east to west, and this form is maintained throughout its height, the difference in width being adjusted in the upper work by throwing the splays and squinches obliquely across the angles, Figs. 3 and 4.

The bell chamber is pierced on all sides by twin windows of two lights each, and embellished externally by a wall arcade, which is continuous round the circular turrets. With one exception these turrets are of smaller diameter than those upon which they stand, and the difference is adjusted by a conical batter immediately below the first string course. The exception is at the north-west angle where the newel stairs is continued to the base of the spire. But there are reasons for believing that when first constructed they were all of the same diameter, and that the newel stairs was not continued beyond the gallery round the bell chamber. There is a total change in construction at this level. Below this point the steps are built on a continuous spiral vault while above it each step is composed of a single stone built into the wall and affording support to that above; and although the latter method was known and practised in the thirteenth century, it is here met with in a more developed form than permits of its association with that period. Further, the head of the stairs is unskilfully contrived and bears the impress of later work, while the entrance to the spire from the stairhead has been cut through the wall and not built with it. Internally the bell chamber is delicately treated and embellished with keel-moulded shafts and carved capitals and corbels.

The construction of the spire is peculiar, and shows considerable originality in design. It will be seen on an examination of the plans and sections that the angles of the bell chamber are slightly splayed, the splay being increased by a shallow arch at the level of the window heads. Squinch arches are thrown across at the head of the walls, but these do not receive those sides of the octagonal spire passing across the angles of the tower, which is their usual function, but are merely bridges, the sides of the spire falling on the tower at these points in the same vertical plane as the splays above-mentioned (Fig. 6). Tall windows are pierced through the cardinal faces of the spire at its base. These have jambs, which, projecting inwards to the internal face of the tower wall and ascending until they intersect the inclined shell of the spire, receive and deflect the thrusts of the spire at a considerable height from its base, and assist in no small measure in its general support (Figs. 1 and 4). The spire windows have double tracery and are most ingeniously designed to form an effective abutment. The angles at the base are reinforced by low broaches and weighted by tall pinnacles. It is clear that the squinch arches here have little or no constructive value; they cannot even help to form a continuous gallery, since the gallery is completely blocked at each cardinal face by the jambs of the spire lights. But they do preserve an agreeable symmetry at the head of the tower, and mask a junction between the tower and spire which, but for their presence, would have an extremely awkward appearance. There can be little doubt but that the upper chamber was designed to form a lantern entirely open to the church, and that it remained a lantern until after the suppression of the monastery in the sixteenth century, when the bells from Oseney Abbey were placed in the tower, and the timber ceiling now between the first and second stages constructed.*



The tower and spire were restored on two occasions during the nineteenth century, about 1856, by Mr. J. Billing, and in 1872-76 by Sir Gilbert Scott. The upper part of the spire was then rebuilt, and its original stonework re-erected in an adjacent garden. The pinnacles were also rebuilt, and the windows, which had been partially blocked, opened out. Iron ties were also inserted at three different levels, the lower two consisting of 1¾ in. iron rods, passed through the galleries on all sides and, piercing opposite walls, secured to glands on the outside. The third system is at the base of the spire, and consists of 1¾ in. square

* Before 1874 this ceiling was situated below the first lantern, but was raised to its present position by Scott.

bars, which intersect at the centre and, passing through the spire lights, are secured as shown in Figs. 2 and 4. About 1880 the bells were removed to the tower over the hall staircase, built for their reception from the designs of the late Mr. Bodley. Though, perhaps, not one of the most imposing this spire over the crossing of Christ Church, Oxford, is one of the most interesting as it is one of the earliest in the country.

The tower of St. Mary the Virgin is built at the end of the north transept, and dates from about 1300. It is of two lofty stages, and is surmounted by a graceful spire, which attains to a height of about 186 feet. Internally the tower is about 20 ft. square, its walls are 4 ft. 6 in. thick, and are pierced on all sides by wide arches or windows in both stages. The adjustment of the octagonal spire to the square tower shows considerable development from the method employed at the tower of the Cathedral. Squinch arches of three orders are thrown across the angles of the tower and the oblique walls of the spire are built directly upon them, while all the internal walls are carried up vertically until a height is reached where the distance between the internal surface and inclined outer face is reduced to that of the thickness of the shell proper (Fig. 12). The angles are weighted by massive pinnacles rising directly from the buttresses of the tower, and formed by connecting the pinnacles above the buttresses to an oblong mass of masonry, which is carried back to and incorporated with the spire itself. This mass is reduced in depth by a weathered surface above the first gablets and is crowned by an upper pinnacle with finial; the whole being panelled and enriched by gablets and crockets (Figs. 7 to 13). In order to qualify the somewhat abrupt break occasioned by the weathered surfaces above referred to small finials are placed upon them (Fig. 8).

The whole of this portion of the design appears to be governed rather by æsthetic than scientific principles, the chief object being to obtain an agreeable outline at the junction of the tower and spire as seen diagonally, this being one of the most crucial problems in the design of spires. But the effect here is very seriously compromised by the cumbrous character of these solid pinnacles which are, as they appear to be, far too ponderous for their purpose. It is only necessary to compare the design at this point with the scientific and refined manner in which the same problem is solved in the spire of Salisbury Cathedral—where the tower is much larger—to realise the relative inferiority of the work here.† At the base of the spire are tall spire lights which assist materially in neutralising its thrusts and contribute in no small measure to its grace of outline. In the niches of the pinnacles immediately above the parapet are twelve statues, principally of saints and bishops. Before the last restoration of the tower nine of the original figures remained while of the other three two had been replaced and one partially renewed in 1852. It was found in 1893 that the statues rested in their niches merely by their own weight, since the iron fastenings by which they were secured to the masonry had been rendered ineffective by rust. They were in such a condition of decay that it was impracticable to insert new fastenings. Eleven of them were therefore advisedly removed and are now preserved in the Old Congregation House to the east of the tower. One of the original figures, however, that of an archbishop, at the south-east corner, it was found possible to retain in position, but the places of the others are now occupied by modern statues, the work of Sir George Frampton. In his rendering of the persons represented the sculptor was given perfect freedom in respect to the three figures of 1852, but in respect to the other eight, against his own and the architect's advice, he was restricted by the University to more or less servile copies of the originals—an undoubted mistake.

During the course of its history this structure has occasioned considerable anxiety and has been frequently repaired. In 1607 the upper parts of the pinnacles were rebuilt after having long remained truncated as the result of a storm. As then finished the gablets of the main oblong blocks, which doubtless had been destroyed, were not rebuilt, but the upper pinnacles placed directly upon their flat upper surfaces. By 1848 the pinnacles had become ruinous and they and the spire itself were thoroughly restored by Mr. C. Buckler in 1850-3. The upper portions of the pinnacles were then rebuilt to approximately their original design, and raised 11 ft. Three years later the fabric was examined by Sir Gilbert Scott who found that the piers and

arches had failed and that the walls had become fissured on three sides. Repairs were then effected, the cracks cut into and bonded, and the tower secured by the existing system of iron ties, a double tie of 1¾ in. rods being placed on all sides at three different levels. In 1893-6 the structure was repaired by Sir Thomas Jackson, who found that the pinnacles had again become so thoroughly decayed, owing to the inferiority of the stone employed, that their practical rebuilding was necessary. He also rebuilt the upper 48 ft. of the spire.

The bell tower of Magdalen College is one of the most conspicuous, as it is one of the most beautiful towers of Oxford. It was begun in 1492 and completed in 1505, and contains a peal of ten bells. Internally it measures at the base 20 ft. 7 in. by 18 ft. 5 in., its walls are 5 ft. 6 in. thick, and it rises in five slightly diminishing stages to a height of 145 ft. at the top of the pinnacles. On the north-east is a wide newel staircase, the lower part of which—now disused owing to its unsafe condition—has a continuous handrail cut out in the stonework of the wall. This tower is a graceful and well-proportioned structure. Its lower stages are plain and pierced only by one small window on each side. All emphasis and decoration is reserved for the bell chamber, which is pierced on all sides by two lofty windows of three lights and surmounted by an openwork parapet with a sculptured band and cornice beneath. The angles are supported by octagonal buttresses, having the string courses at each stage broken round them. At the belfry stage there are also intermediate buttresses which are carried up between the windows and terminate, like those at the angles, in tall pinnacles. A ceremony inseparably connected with this tower is that performed at daybreak on the 1st of May in each year, when the choristers ascend the tower and chant a hymn in Latin to the Holy Trinity, this being followed by the ringing of the bells in full peal. The origin of this ceremony is obscure, but by the early part of the 19th century it had degenerated into most irregular use, secular tunes were sung, and the passers-by below occasionally received the attention of the choristers in the form of eggs and other missiles. But about 1844 the service was set in its present form, and has been since reverently observed.

Tom tower, built on the west side of the Tom quadrangle of Christ Church, is of two periods. The lower part, forming the gateway into the quadrangle, was built by Cardinal Wolsey in 1526, while the upper part was added by Wren in 1680. As left by Wolsey, though the flanking turrets on the west side were carried up to their present height, the main block was only built to a level just above the archway and not covered in. It was evidently Wolsey's intention to build an oriel window immediately over the archway at the west, for he had constructed its base, as shown in Loggan's print of 1673. This would have grouped well with the side turrets if they and the oriel itself were carried sufficiently high, as was doubtless intended. On the renewal of building in 1680 the original design for the upper part was abandoned entirely, the base of the oriel was swept away, and a deeply recessed window constructed in its place. Wren has been adversely criticised for this part of the work, but it must be remembered that the effect of the oriel would depend upon the height of the flanking turrets and upon the general design of the upper part of the tower. The design being altered, the rearrangement of the base was amply justified. Wren built the rich fan vaulting over the gateway and finished the tower with an octagonal lantern, covering both the lantern and the turrets with cupolas. The construction at the base of the lantern is shown in Fig. 14. The Bishop, Dr. Fell, desired that an observatory should be placed on the top of the tower, but Wren threw the weight of his advice against the scheme, and it was abandoned. Tom tower has been repaired repeatedly, and when examined in 1910 little of Wren's stonework was found to remain. The fan vaulting, however, with its fine series of shields, was intact. The structure has been recently restored by Mr. W. D. Caröe. Great Tom, brought from Oseney Abbey in 1546 and recast in 1680, hangs in the tower, and still tolls 101 times each night after the Colleges are closed at 9 p.m., 101 being the original number of students in the foundation.

BOOK REVIEWS

The Architect in Practice. By Harry Barnes, Vice-President of the R.I.B.A. With a Preface by J. A. Gotch, F.S.A., F.R.I.B.A. London: Ernest Benn, Ltd. Price 7s. 6d. net.

This book is written to fill a gap in the literature of the architectural profession, and the author has ably succeeded in the task he set himself to accomplish. We are surprised to read, and yet we do not doubt that the book is the first to deal, in a strictly practical way, with every phase of actual architectural practice, including training, office routine, professional etiquette, the relations between architects and their clients, the execution of commissions, and much other information indispensable to all practising members and students of the architectural profession. The work consists of an introduction followed by nineteen short chapters briefly and clearly describing the various duties and responsibilities of an architect in practice, and every young architect and many others would do well to read an author who is a guide, philosopher and friend. Not only is the practice of the architect described, but many of the difficulties, dangers and uncertainties confronting the young architect are pointed out with tact and discrimination. Many wise and helpful suggestions are made which cannot fail to be of use to those starting a practice, and we confidently recommend the book to our readers.

House Painting, Glazing, Paper Hanging, and Whitewashing. By A. H. Sabin, M.S., D.Sc. Third edition. 7s. 6d. net. (Chapman & Hall).

The author describes this as a book for the householder, and anyone who contemplates painting his own house will do well to read the work. In this edition some additional matter has been added to guide the amateur who wishes to mix his own paint. A number of formulas are given, showing the amount of stainers required for different coloured paints. Many hints are given as to the various methods of painting galvanised iron pipes, tin roofs, and newly-plastered walls and the use and care of brushes, which are nowadays an expensive item. The book being written for the American public, the various prices of paint are quoted in dollars. Papering to walls, whitewashing, and kalsomining are dealt with in a simple way. The book can be recommended to the amateur and craftsman.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS CONFERENCE AT OXFORD

THE members of the R.I.B.A. Conference, which is being held this year in Oxford, assembled in that city on Wednesday, and were received in the evening by the Vice-Chancellor of the University in the Hall and garden of Wadham College.

On Thursday the members assembled for the inaugural meeting in the Sheldonian Theatre, Broad-street, when Mr. E. P. Warren, F.S.A., delivered a lecture entitled "An Historical Sketch of Oxford." After some preliminary observations, he said: Of the antiquity of Oxford it is impossible to speak with any precision. Its site: on a broad spit of gravel between two rivers, which, with their tributaries, made it at once so difficult of hostile, and so easy of friendly access. The fish, the wattles and the reeds afforded by those rivers, and the pasturage of the level meads watered by them, all contributed to render it the inevitable site in the first place of a primitive settlement, and later of a fortified town.

That it was an important town as towns went in the earliest times of which we have record, there is abundant evidence.

One of the first essentials in the position of an ancient town was its possibilities of defence. To the site of Oxford the many bifurcations; and the double, and, in places, triple, channels of the Cherwell on the East and South-East, and their junction with the broader stream of the Thames, which, in its course from the North-West, protected the Western and Southern sides. Thus only the North side remained to be protected by a ditch or moat, joining Thames to Cherwell. These features offered peculiar facilities of protection, and could be, as they were, increased by using the earth dug from the moat to form the ramparts of the town and the mound, which still remains as an evidence of primitive fortification, to protect the Western approach.

The position of Oxford, nearly in the centre of a line between the estuaries of Thames and Severn, and upon the line of junction of the primitive land routes from North to South, and East to West, added to its inevitable character as a stronghold and a mart. It offered relatively easy communication with the port of London and the sea, as well as with the fortresses of Windsor and Wallingford. Its primitive walls were probably mere palisades of stout timber, but against primitive weapons and forms of attack, these were sufficiently formidable, though, as we shall see, whatever security they offered did not avail against a determined enemy.

The most determined, and the most dreaded of enemies, were the Danes, to whom the Thames estuary offered a ready means of approach, not only to London, but as far as tidal water would carry them, say to Teddington, or, on flood tides considerably higher, and who on several occasions pushed high up the Thames, left their ships, and marched through the forests of the Chilterns to fall upon Oxford, which they ravaged and burned at least upon three successive occasions, in 979, 1002, and 1010.

The name of Oxford, Oxenford, or Oxnaford, as it was originally known to the Saxons, is sufficiently explanatory, as a ford for oxen, just as Hertford was the hartsford, or a ford for deer. Oxford, however, possessed three fords at least, and after a long summer drought probably more, in the days of the relatively shallow and rapidly running uncanalised rivers. It must have been a place of some importance as early as 912, as it was then coupled with London in the English Chronicle, in relation to the death of Ethelred, Ealdorman of the Mercians, and the succession of King Eadweard, who "took to himself Lundenburg and Oxnaford, and all the lands that were obedient thereto."

It was successively the central Southern frontier post of the Kingdom of Mercia, and the Northern of that of Wessex. It was frequently the meeting-place of the Gemot, and seems to have been the place of the coronation and death of the first Harold, if not his capital. The Gemot probably assembled upon the castle mound, as, when it could not be accommodated in a natural amphitheatre, like that of the Moot Hill near Salisbury, its meetings were customarily held on some sort of hill slope.

By the end of the tenth century, Oxford, rebuilt and, as the times went, strongly fortified, and possessing at its Western extremity, some sort of castle or fort upon the mound in the river loop before referred to, possessed churches, the dwellings of citizens of various degrees, and a market, and early in the eleventh century, had erected a stone tower which, by the middle of that century was, in all probability, its most conspicuously new, as it is now its most conspicuously ancient, feature, the tower of St. Michael's Church.

When, in the memorable year of 1066, that blessing in disguise, the Norman invasion, fell like a thunderbolt on Southern England, and within a few weeks of the battle of Hastings had obliterated the rivalries of Mercia and Wessex, had overwhelmed all opposition, capturing or more often making unopposed entry into fortified places, Oxford was a town of considerable wealth and importance, important enough, in any case, to receive very speedy attention from a Norman army, and to witness the determined entry of D'Oilgi's force, splashing across the fords of Cherwell and Thames, in jingling chain mail, and conical topped helmets, pennons fluttering, kite-shaped shields rattling, and long swords clanking ominously. Whether the castle on the mound, or the town with its bulwarks, or both, resisted for a while, there is no certain means of knowing. Some think that there was a short siege, others that submission was immediate. What is very certain is that the conquerors lost little time in taking accurate stock of their new possessions, in repairing the walls and bridges, and in setting to work, no doubt with forced local labour, to build a powerful fortress on the site of the Saxon stronghold and its mound.

With the establishment of the Normans, and the Domesday Survey, we at once get upon a firmer footing as to facts and dates, and, by the evidence of that invaluable compilation, we learn that very soon after the Conquest, there were at Oxford 243 houses paying "geld" or tax, and 478 unoccupied and ruinous, probably as the result of the recent fire, and, at any rate, unable to pay tax. The King had twenty "wall mansions" which were Earl Algar's in the time of King Edward, "paying" as it is stated "both then and now fourteen shillings less twopence; and one mansion paying sixpence, belonging to Shipton, another paying fourpence belonging to Bloxham, a third paying thirty pence, belonging to Risborough; and two others paying fourpence, belonging to Twyford in Buckinghamshire; one of these is unoccupied." They are called wall mansions because, "if there is need and the King command it, they shall repair the wall."

Further we learn that "All the burgesses of Oxeneford hold in common a pasture outside the wall that brings in six shillings and eightpence." This pasture is the noble Port Meadow which the burgesses still enjoy, and the income from which seems as modest as the house rents.

Another of the Conqueror's officers, Roger of Ivri—Robert d'Oilgi's brother in arms—held fifteen houses in Oxford and considerable other property. D'Oilgi began to build the Castle, the great "donjon" or Western tower of which still exists, alongside the Saxon mound within the lines of the old moat, and upon the bank of the mill stream. The old Mill, inventoried in Domesday Book, still exists and functions under a modernised form.

Other relics of d'Oigli's building activities are the very interesting and typical Norman crypt of the Church of St. George under the lee of this tower, and the remarkable vaulted Well Chamber on the mound built above the 70-foot shaft of the well.

Further remains of Norman work in Oxford are fairly plentiful, but less homogeneous.

The cathedral is a Norman church, though much amended, and overlaid by later work. In St. Peter's-in-the-East you have the remarkable and beautiful chancel, and most characteristic and interesting crypt. There is Norman work in Holywell church, notably the Chancel arch, and a Norman cellar or crypt (either name will serve—the choice is between Latin and Greek derivation) at Frewin Hall.

A couple of miles or less to the Eastward of the city is the wonderful little Norman church of Iffley, built in the second half of the twelfth century.

All these instances show the robust, round-arched Norman manner very characteristically.

The Normans were not, of course, the first builders of churches in and around Oxford. The evidence of the building itself seems to show that the tower of St. Michael's Church, was prior to their arrival. It was probably damaged by siege or the recent fire, and partial rebuilding, therefore, necessary. The names of Saxon and of Celtic Saints appear in the records of pre-Norman dedications, such as St. Werburgh, St. Mildred, St. Frideswide, and St. Budoc, and it is probable, if uncertain, that besides the nunnery of St. Frideswide, there existed various small religious houses before the Conquest, and that there were schools attached to these which formed the humble beginnings of the great place of learning that was to come. It is at any rate certain that the permanent establishment of the Normans and their soldiery was followed by those of religious orders from France. And this was only natural, for the Normans, albeit hard and dour, were devout, and their religion was a necessary part of their civilisation. Furthermore, they were astute enough to welcome military strongholds, large monasteries, which represented increased man power, in case of trouble. This reason may account for the later conversion of the nunnery of St. Frideswide into a Priory.

The various orders came in rigid succession, the first, apparently, being the Dominicans or Black Friars, to whom lands were given in the Jews' Quarter, these they subsequently sold, and re-established themselves in St. Ebba Parish, where they built a House, Church and Schools, of which I think there is little or no vestige but the names of Blackfriars-road and street.

Next came the Franciscans or Grey Friars, who were similarly established, and grew from the humblest beginning and the appropriate simplicity and poverty of their rule, to affluence as well as learning. They also built a large Convent, a Church and Schools. Later came the Benedictines, and the Carmelites or White Friars, all bringing Latin and French, and establishing schools.

The great Abbey of Osney, West of Oxford, was founded early in the twelfth century for Augustinian, and, the abbey church is reported to have been of great magnificence, and when Oxford ceased to belong to the immense diocess of Lincoln, the abbey became a cathedral and the abbot a bishop. Nothing of this Abbey remains to-day, and little of any of the other religious houses, such as Rewly Abbey, that surrounded Oxford, Their schools and influence of those schools, and the scholarship promoted amongst the various orders, greatly helped to establish the early repute of Oxford

as a place of learning allied to religion, a conjunction that was accepted as so obvious and natural, that in the early days of the University, its chief secular business, its meetings and disputations were carried on within the walls of the University Church of St. Mary the Virgin, before the building of the Divinity School, and the "Old" Schools in the Quadrangle beneath the Bodleian Library.

Learning at Oxford was, in the early days of the University, not well housed, but as time brought increased wealth and increased numbers, it brought with them an increased demand for appropriate buildings, and a natural desire for architectural dignity. So from uncertain and humble beginnings, through times of great hardship and difficulty, strife and disaster, through pestilence and famine, oppression and war, the little University in the little town between the rivers, has grown to world-wide fame and immense influence and prestige, and the town to a city celebrated for the beauty, the character and the interest of its buildings.

To understand Oxford of to-day, it is first necessary to understand the form and disposition of mediæval Oxford, the little walled town compressed with its fortifications, some of which happily survive. This, as you will see by old maps, presents the plan of an irregular oblong, rather sack-like in form, roughly speaking, some half-mile in length from East to West, and quarter-mile in width from North to South, and having a more or less square eastern end or base, and converging at the west end towards a nearly circular head, which is the Castle, with its enceinte and the moat formed by artificial extension of a river bend. Agas' and other old maps show the walls quite clearly, and you may still, and with ease and comfort, see a considerable length of the northern and eastern portions, which form the boundary of New College garden, where you will see a typical bastion, and may observe that the beautiful little bell tower of that College occupies the site of another bastion, and was, in fact, a defensive tower in the fortified line. The outer side of this wall is fully visible on the north side of New College, and at intervals behind the houses of Long Wall, where the Eastern side of the old city wall ran southward to the East Gate, at the end of High-street, and thence south-west and westward enclosing Merton College, where further portions of wall and bastion may still be seen, to enclose Corpus College and Christ Church, just west of which was the South Gate, and the bridge or Grand Pont, thence skirting the southern side of Pembroke College, to turn north-westward towards the Castle ditch and the Western City Gate; and north-eastward to the North Gate flanked by St. Michael's Church and the tower jocularly known as Bocardo, and so called, it is said from a difficult figure in logic, easier to get into than out of, now long demolished, and which had a somewhat dismal history as a jail or lock-up. Thence the wall ran eastward, along the southern side of Broad-street, crossing the site of the Sheldonian Theatre, and passing behind that of the old Clarendon Press building, where it is indicated by lines cut into the pavement, to continue to the Tower of New College before referred to, but pierced, just north of Hertford College and the Chapel of St. Catherine, by a small gate which was known as Smith Gate.

It will be seen that several of the old Colleges lie outside of the walls, Balliol, Trinity, St. Johns and Wadham to the North, Worcester—formerly Gloucester Hall—to the North-West, and Magdalen to the East, six in all, but all, excepting perhaps St. Johns and Wadham, built during a period when city walls were still of importance. It was necessary then that the extra mural Mediæval College should be something of a fortress in itself.

The thirteenth century had seen much new work in the Cathedral, and most of St. Giles' church, with its very unusual, four gabled south aisle and lancet windows, built before the end of its first quarter. The middle of the century added the handsome arcaded belfry stage to the Cathedral tower, and the short octagonal spire, and columnar angle pinnacles. Towards its end, and in a manner changing rapidly to what we know as the Decorated or Early Fourteenth-Century manner, came the beautiful choir of Merton College Chapel, and the elaborate shrine of St. Frideswide in the Cathedral. The fourteenth century had added much that still remains at Oxford, including the rebuilding of the old city wall, much of which is still to be seen. But Oxford, like so many other English towns, suffered in its building activities and its crafts the deadly arrest of the Black Death, which paralysed them for a score or so of years after 1348, and you will find little work dating from that period of gloom and depopulation.

The fifteenth century, busy and active, added immensely to the buildings of Oxford, much that has disappeared, and much that most happily remains. This period, indeed, set a fashion of College architecture in Oxford that prevailed in essentials into the seventeenth century. The fifteenth saw the transepts and fine tower of Merton completed, Balliol hall and library built, All Souls Font Quadrangle and Chapel, the Divinity School, and at Magdalen St. John's Quadrangle, the Founder's and Muniment towers, the Chapel, hall and cloisters, and finally, at its very termination, the admirable bell tower begun at the close of the century and completed in the early years of the sixteenth, a fitting culmination to a splendid group.

The sixteenth century saw Wolsey's ambitious and magnificent conversion of a monastic "house" into his Cardinal's College, now Christ Church, the building of the noble dining hall. The Great Quadrangle, which contains the Canon's dwellings, and the various offices of the College, and forms a splendid vestibule of approach to the Cathedral, the long and finely-proportioned front, with the great central gateway, and the flanking and angle turrets along St. Aldate's, the gate tower of which remained unfinished till Wren added, late in the next century, the belfry that houses "Great Tom." This century was, later, too much disturbed by the Reformation and religious and political troubles, until its fourth quarter, for much building; but what it did build was mostly in conservative "Perpendicular" Gothic, a manner it carried on, albeit with some semi-classical embellishments, well into, as we have seen a little beyond the seventeenth century.

Of early seventeenth-century architecture, of Elizabethan and Jacobean work, Oxford is full in its University, Collegiate and Domestic buildings. To the later seventeenth and early eighteenth centuries, Wren and his followers contributed many buildings which, after two centuries or more, are characteristic features of the Oxford of to-day.

I do not attempt to describe these buildings; they are before you, and you will see them for yourselves, under the conduct, if you so desire it, of the initiated ladies and gentlemen who have volunteered for the service.

In England, and especially in Oxford, the native local style of building lingered long after the partial adoption of a foreign manner, known as that of the Renaissance, and derived from the French, the Flemings and the Germans, who were copying the Italians, who were copying, more or less, the remains of Roman buildings and Greek statuary, which they were rediscovering.

The acceptation in this country was, for a long time, slow and half-hearted, and, throughout England, and more particularly in the West, there are many curious and interesting instances of survivals of and reversions to the native manner of Gothic architecture, but none, as far as I am aware, more marked than in Oxford, which has been called "the home of lost causes," and has certainly been so in regard to native Gothic architecture, when that was already a lost cause elsewhere.

To cite three well-known instances, you have the deliberately Gothic College, founded, endowed and built, I think, about 1610, by Nicholas and Dorothy Wadham. This College was destined, curiously, a little later to become the academic cradle of our greatest "Renaissance Architect," Sir Christopher Wren, who, however, had his moments of reversion to Gothic types.

You then have two remarkable anachronisms in manner. The elaborate porch, actually Gothic in its general conception, but most deliberately and determinedly classic in detail and intention, added in 1637 to the Gothic University Church of St. Mary the Virgin, by the gift of Archbishop Laud's chaplain, Dr. Morgan Owen, and by a designer of uncertain identity, thought by some to be Nicholas Stone, an attribution to which I personally incline. Three years later the beautiful fan-vaulted staircase of Christ Church Hall, deliberately Gothic in all constructive essentials and in general effect, but bearing indications of its actual period in its roof bosses and minor details.

There is, however, a still more startling instance of anachronism, of which I have only become definitely aware quite lately, in the buildings forming the east and west sides of the Middle Quadrangle at Oriel. These, with their mullioned windows, their doorways, string courses, and hood moulds, and their coped and curvilinear gablets, all in the pronounced manner of the early seventeenth century, or, as we call it, Jacobean Gothic, date from the early years of the eighteenth century—1719 and 1723. You will see, therefore, that the student of architecture in Oxford must be well instructed as to dates, or walk warily in regard to attributed periods. He needs local as well as general historical knowledge.

The remainder of Mr. Warren's paper will be given in our next issue, together with a Report of the Conference proceedings.

Housing in Amsterdam.

The Report of the Housing Department for 1922, contains interesting details regarding this work. Although in 1920 only 737 new dwellings were built, in 1921, 3,178 were erected, and in 1922, 6,384. The population of Amsterdam is about 700,000. Rather more than half of the houses built during 1922 were built by private builders, most of them receiving Government subsidies. It is estimated that there was still a deficiency of 16,537 houses at the end of 1922. There has been a considerable reduction in recent years in the number of basement dwellings, the figures for 1922 being 1,246 dwellings of this type as against 2,707 in 1909.

Thames Bridges.

The Council, on May 20, invited the City Corporation to join the Council in an inquiry into the existing and future provision of means of road transit across the Thames, and to inquire into the whole question of the adequacy, condition, &c., of existing bridges and the necessity (if any) for additional means of transit across the Thames within the administrative county of London, and to formulate a general policy on the subject.

The City Corporation has replied that the Court of Common Council, in view of an undertaking given to the Minister of Transport that the Corporation would defer further deliberation upon the St. Paul's Bridge Scheme until it should have received the consideration of the proposed Traffic Committee to be set up under the London Traffic Bill when it becomes an Act, do not consider that it would be possible for the Corporation to take part in the inquiry proposed by the London County Council until the question of St. Paul's Bridge has been considered by such committee, but at the same time desire that the London County Council should renew its invitation after such consideration has taken place.

The General Purposes Committee of the Council state they are sure the Council will be pleased to have the valuable assistance of the City Corporation as soon as the Corporation considers itself free to accept the Council's invitation. They feel, however, that so far as the Council is concerned, the question of cross-river transit is so urgently in need of settlement that there must be no delay in considering it in all its bearings. They propose, therefore, that the Council should set up at once a Special Committee with the same reference as that of the proposed Commission of Inquiry. They trust the Corporation will subsequently, be able to participate in the Inquiry.

UNIVERSITY OF LIVERPOOL

THE EARL OF CRAWFORD AND BALCARRES recently opened the annual exhibition of architectural drawings by the students of the School of Architecture of the University of Liverpool. Mr. H. A. Cole, chairman of the Libraries, Museums, and Arts Committee, presided, and was supported by Dr. Adami (Vice-Chancellor of the University), Mr. Hugh R. Rathbone, M.P., Mr. C. Sydney Jones, M.P., Alderman John Lea, and Professor C. H. Reilly.

Professor Reilly, in an opening statement, said the Liverpool School of Architecture, which was the oldest in the country, had deliberately set itself to envisage architecture as a great civic art. His ambition was that the school should some day have a group of professors and develop on the lines of the Academie des Beaux-Arts.

Lord Crawford, in the course of his remarks, said the Liverpool School of Architecture, in its personnel, was not a purely Liverpool or Lancashire institution. No fewer than two-thirds of its students came from distant parts, many from their overseas Dominions and Colonies. Popular interest in architecture was growing steadily and consistently, and, if well guided, would grow intelligently. Every private or business structure—even the chimney-stack—should share the dignity of their great public buildings, and thus contribute towards the improvement and ennoblement of their cities. The public was demanding more and more from its architects.

After expressing the hope that the people of Liverpool realised what an asset they possessed in the School of Architecture, his lordship said he believed that was almost the only school in the country which had its own department of town-planning and civic design.

Mr. Hugh R. Rathbone, M.P., proposed a vote of thanks to Lord Crawford, which was seconded by Alderman John Lea.

We give below a list of the awards:—

Degree of B.Arch.

FIFTH EXAMINATION.—Honours in Architectural Design—Class I: D. G. Bridgwater, H. S. Silcock. Class II: C. T. Bloodworth, J. H. L. Owen. Honours in Architectural Construction.—Class I: R. W. Donaldson, A. L. Gabr, R. H. Turner. Ordinary: E. H. Ashburner, W. V. Jenkins, J. H. Miller.

FOURTH EXAMINATION.—Honours in Architectural Design: F. N. Astbury, H. S. Silcock, T. T. Wills. Honours in Architectural Construction: C. C. Shaw. Ordinary: H. A. Peters, H. G. Phillips.

THIRD EXAMINATION.—A. Aspland, Norah Dunphy, H. G. C. Spencely.

SECOND EXAMINATION.—E. F. Davies, G. A. V. Hall, R. G. Heal, May Hutchinson, K. R. Mackenzie, M. Mokhtar, G. A. Ridge, M. Z. el Tawil, Olwen Vaughan.

FIRST EXAMINATION.—S. J. Docking, W. A. Eden, G. C. Hough.

FINAL EXAMINATION.—(Old Regulations): A. O. Chatterley.

Diploma in Architecture.

FIFTH EXAMINATION.—Distinction in Architectural Design—Class I: F. X. Velarde.

FOURTH EXAMINATION.—Distinction in Architectural Design: Frances T. Silcock, H. Thearle, Maud A. M. Wall. Ordinary: H. B. Evans, G. E. S. Hereward.

THIRD EXAMINATION.—G. A. Butling, J. Heald, M. Roushdy, A. C. Todd, L. G. Zwinger.

SECOND EXAMINATION.—A. C. Cotton, W. H. G. Dobie, D. Hall, T. C. Haynes, O. G. Lewis, I. D. MacGillivray, J. B. Maxwell, J. G. Metcalfe, Majorie M. Mocatta, C. E. Moore, H. B. Stout, B. A. Sumner.

FIRST EXAMINATION.—H. Bramhill, P. J. Doran, A. Owen, H. H. Powell.

Certificate in Architectural Design.

A. G. Jenson.

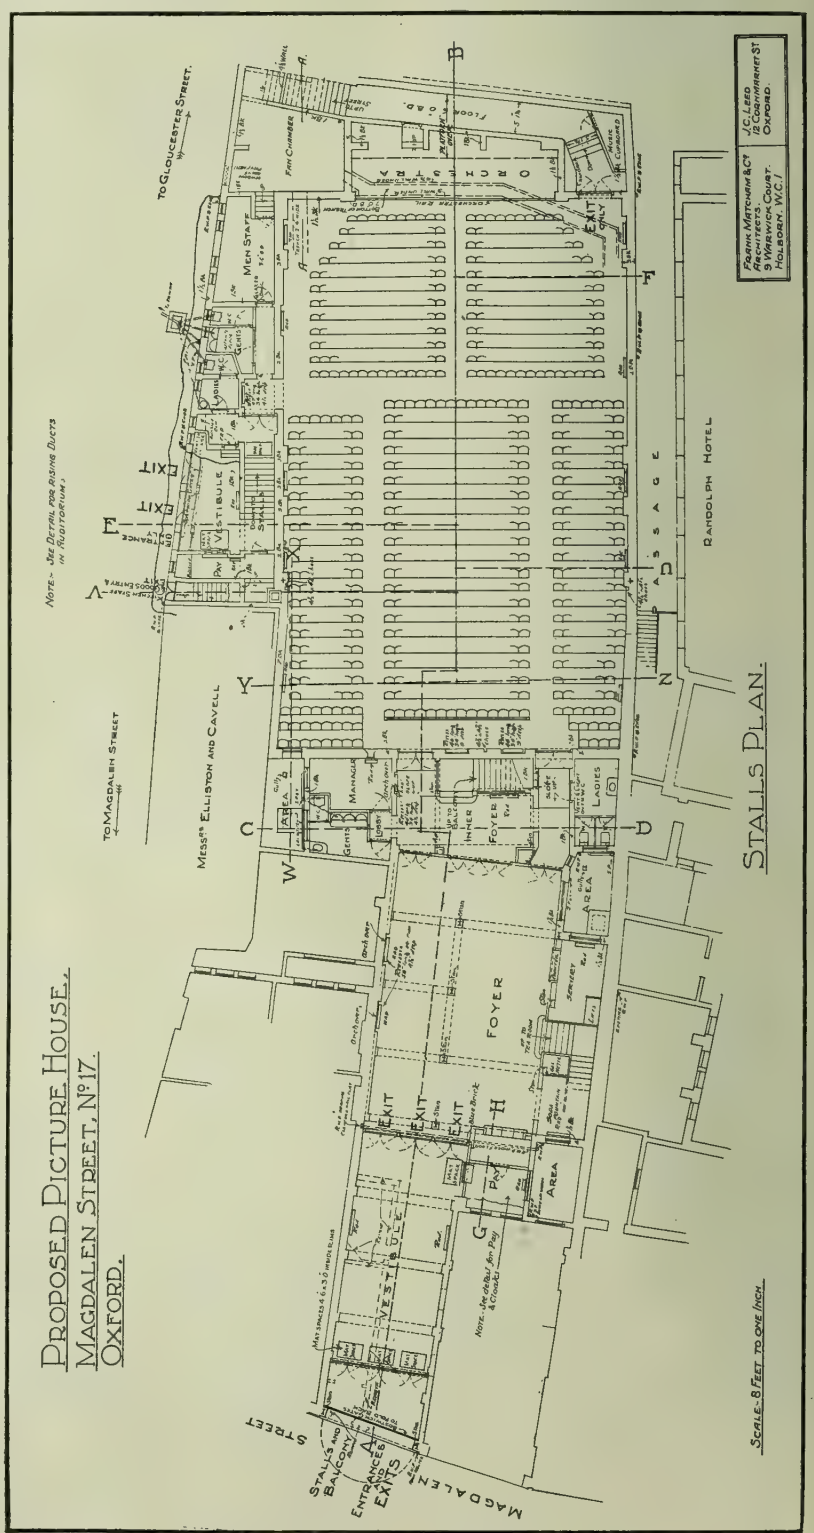
Scholarships and Prizes.

Holt Travelling Scholarship (£50, 3rd year): G. A. Butling.

Honan Travelling Scholarship (£50): H. Thearle.

R.I.B.A. Jarvis Travelling Scholarships (£50 each): F. N. Astbury, C. C. Shaw.

Holland and Hannen & Cubitts' Prizes for Working Drawings: (1st Prize, £15), A. L. Gabr; (2nd Prize, £10), J. H. Miller and R. H. Turner.



White Star Prize for the Decoration of Part of a Liner (£10): F. X. Velarde.

John Rankin Prizes for Sketch Designs (£12 each): Fifth year, F. X. Velarde; fourth year, H. Thearle.

Lever Prizes in Architecture, 3rd year: (1st Prize, £15), H. G. Spencely; (2nd Prize, £10), J. Heald.

Lever Prizes in Civic Design: (1st Prize, £15), T. H. Forshaw; (2nd Prize, £10), F. N. Astbury.

Technical Journals Essay Prize: (£5), H. S. Silcock.

Picture House, Magdalen-street, Oxford.

MESSRS. FRANK MATCHAM & CO., AND J. C. LEED, Architects.

CORRESPONDENCE

[While we are glad to publish letters on professional and other matters of interest to our readers, it must be understood that we do not necessarily endorse the remarks of correspondents, who will oblige us if they will express their views as briefly as possible.]

Building Trades Dispute.

SIR,—As a practising architect I am, of course, indirectly interested financially in this dispute, but I am more concerned with the welfare of the industry as a whole than with the financial position of individuals. The publication of the Interim Report of the Foster Committee, and the welcome given to that report in the press generally at the time, seemed to justify the optimism of those who thought the building industry would be the first of our great industries to introduce that reconstruction which the country had been promised during the war period. The scrapping of the Foster Committee Report caused much disappointment to many in the industry and many others interested, because it set back the hands of the clock, and killed the good will which had been created by the trials of war and fostered by the Report.

When it was announced that the Minister of Health had arrived at agreement with the building industry, it was once more felt that employers and operatives must have returned to the better frame of mind engendered by common risk, and that once more there was some hope that the obvious truth would be recognised that the interests of capital and labour are identical and profits depend upon good will, trust, and maximum output.

It was, therefore, with surprise that the public received the news that a deadlock had arisen; and with relief that we learnt that a settlement had been arrived at on June 20. Although many doubts were raised as to the wisdom of the Minister's agreement with the industry, it was widely felt that it was worth some risk to attain agreement between employers and operatives in one of our great national industries, and the public appeared ready to accept the assurances that all would be well with housing, and peace would reign in the building trade.

It is of the greatest importance that the general public should form a clear conception of the real position. A false impression, honestly believed, may, and probably will, have exactly the same effect as if it were the truth; further, in every strike or lock-out, the side which carries public opinion with it will, and must, eventually win. It behoves members of the public, then, to watch the enquiry closely and to express their opinions strongly upon the result.

I, of course, do not pretend to know whether the Employers' Federation is justified or not in calling for a lock-out, but I am quite sure the general feeling is against it. What could the operatives' representatives have done, or what did they leave undone, in order to have settled the Liverpool dispute? It must be obvious that it was—and is—more in their interest even than that of the employers, to settle the unofficial strike, which was a greater menace to their influence than to the employers. In the public mind the impression appears to me to be that the employers have repudiated a bargain and have committed the very fault for which they blame others. As I have said before, the important consideration is, *does the public so think?* Not is it justified in thinking?

I know the working man too well to overlook his faults, and I know how unreasonable he can be, but he is not alone in this. Some employers are more unreasonable than the worst of their employees. I know some who still hope to kill trade unions. In refusing the extension of time for the lock-out and rejecting the suggestion of an enquiry, the operatives have shifted public sympathy from their side to the other for the time being, and it is probably true to say that both sides are equally condemned by public opinion, which is once more full of doubt with regard to the Government policy of trust in an industry so divided where unity is essential.

Capital and labour are as necessary to each other as light and air to both. The interests of employer and employee are identical. Organisation on both sides is essential. The honouring of agreements is as vital as good will. All classes, as all individuals, have faults as well as virtues, and in all negotiations there must be forbearance and "give and take" in a generous spirit. In this world—as it is hoped in the next—we must progress.

The industrial history of this country is not pleasant reading, but is more read by working men than by employers. Progress must mean some form of reconstruction of our industrial system, and blaming men for their folly will lead us nowhere; what we want is insistent, consistent, diplomatic education with regard to the facts as they exist, and constructive statesmanship to provide a future which will give men hope and prevent the fatal habit of always looking backward instead of forward.

It was because of the admission of the need for reconstruction that the Foster Committee Report seemed to promise good things for the building industry, and if one could only retire the "Diehard" employer, and the revolutionary employee, we might yet see the light. These are not only my personal views, which are unimportant, but those of many others, and amongst them some builders.

JOHN E. YERBURY.

Oxford: The Taylorian Museum.

Housing Costs.

SIR,—With reference to our letter regarding a suggested method for obtaining houses *versus* the Government proposals, which appeared in your issue of June 13, we now beg to reply to one or two of the criticisms in your issue of June 20.

"Did we include sewers and roads in the £500?" Yes; because we have recently accomplished it within this figure. "Do we propose building on leasehold land?" No; freehold; but in the value a long leasehold makes no difference.

There is a criticism bearing on the price of the land. Some local authorities have offered *to give the land*, in order to assist in obtaining the houses.

The cost of maintenance and management may vary according to how the houses are built, and whether or not a builder's clerk or a commission agent collects the rents. In "Repairs," *re* actual houses we have in mind, the cost is not £7 10s., and the management is within the figure we stated.

We have built cottages on the financial basis mentioned, and there has been no difficulty in getting the 12s. 6d. per week. If non-parlour houses were built, the rents would be 10s. 6d. per week.

In calculating outgoings, the annual sinking fund to repay the mortgage is an annual saving of actual cash, for at the end of the period the house is paid for by it, and this should not be overlooked. But whether there is some small variance, higher or lower, in the calculations, the fundamental principle, we suggest, is unaffected.

The Government proposal is for an annual subsidy, equal to a one-sum payment of £160 or more, and, for the great number of houses proposed, it means a colossal sum which our impoverished country cannot afford. We are not only architects, but citizens, and this mounting up of national capital expenditure affects us both ways. At one time, the thought of the weight of the present financial burden led to a proposed national levy to lessen the outgoings. The same minds now bring forward a scheme to add to the burden another thousand millions.

Let architects remember that the greater the taxation the greater the cost of everything, with consequent loss of ability to successfully compete in the world's trade; and the less profitable trade that is done, the smaller necessarily must be the amount available for building. Under such circumstances, it is our duty to speak and act when this hill of expenditure is becoming a mountain. In connection with housing, we are beginning at the wrong end. We all agree in the need, but not in the method. The Government—that is the country—can obtain money at a rate of interest that the ordinary individual cannot obtain it at, and can lend the money at this lower rate without cost to itself on good security, and at the same time can give the one great assistance for the erection of the houses which he needs, namely, cheaper money.

The principle we advocate is that the houses can be obtained by lending the money instead of giving it; thus helping trade instead of handicapping it. We named 4 per cent. If 3½ is necessary there is still no loss.

The cost of a parlour house, &c., is given at £500; but it ought not to cost as much, and certainly would not if each man were allowed to work his best. This applies not only to the bricklayer, but to the brick-maker, and so on throughout the building trade in materials and labour. In America, amongst other things, labour takes a wider view, looking upon building operations in a different spirit to that obtaining here. There they can see further ahead, apparently, the principle being that the quicker a place is built and utilised, the sooner the owner gets a return on his capital on land, building and business therein, and the greater

inducement for someone else to follow his successful example. To a great extent from this cause come big wages and employment. In this country the wrong principle predominates. "Slack off" and do not encourage labour-saving mechanism, so that more men must be employed at the moment, seems to be the order of things, and this naturally results in a want of confidence in the man who might build, but is thus warned against so doing. Hence, to a great extent, lower wages than in America. There are other reasons, but this is the main one. And the result of this slackness is undermining England's prosperity and England's future.

In avoiding this abnormal and crushing housing outlay by other and more reasonable ways, we shall be doing something towards the national welfare. Before it is too late, could not the Royal Institute go to the root of the matter and report upon the subject as to what is possible towards saving (by the alternative of lending) this vast outlay of our national resources? It is worth while even in the minor interest of the profession and its business end, and much more worth while from a national point of view.

Chas. Heathcote & Sons.

ARCHITECTS' AND BUILDERS' INQUIRY BUREAU

*** *We are glad to give questions and answers, but cannot accept responsibility for contributed replies, especially on legal matters.*

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or better still, in typescript?—Ed.

21 Oz. Glass.

Sir,—Can you tell me the difference in price per house when 21 oz. British glass is used instead of 15 oz.? The former glass will give, I understand, a practically flawless window.

M. T.

Treatment of New Walls.

Sir,—In regard to treatment of walls in new buildings, if the walls have not had time to dry out and surfaces have been treated to lime putty finish, for what period should they be left before it can be taken that drying is complete, and that the soda, &c., has worked out?

A. G.

Party Walls.

Sir,—A 9 in. party wall divides "A's" garden from that of "B." The wall has been thrust out of perpendicular into "A's" property, apparently by a tree growing close to the wall in "B's" property.

The wall is now in a dangerous condition and notice has been given by the local authority to have it rebuilt. By whom should the expense be borne?

"F. J. P."

Garage Doors.

[Reply to "Building."]

Sir,—In reply to your correspondent, I know of a very excellent apparatus in the form of top suspended doors, sliding sideways and drawn round along the side walls on quadrants at top and quadrant grooves at bottom. I should be pleased to let him have particulars if he is interested, as I am sure such an arrangement will meet all his objections. The price is extremely reasonable.

Architect.

[We have received further replies to "Building" and "Insulation," whose queries appeared in our issues of July 4 and June 27 respectively. They have been forwarded to our correspondents.]

THE WEEK IN PARLIAMENT

Westminster, *Wednesday.*

Size of Subsidised Houses.

Mr. T. Thomson asked the Minister of Health if he was aware that since the introduction of his Housing Bill the representatives of over 300 local authorities, representing the chief cities and towns in the country, assembled in conferences at Newcastle-on-Tyne, Manchester, Sheffield, London, Bristol, and Cardiff, had in all cases unanimously passed resolutions protesting against the subsidy being limited to the small type of houses named in his Bill; and, in view of this unanimous feeling in favour of a larger house, would he take powers which would enable him to grant the subsidy to houses of an additional 100 superficial feet on the recommendation of the local authorities concerned?

Mr. Wheatley said he could not accept the suggestion that local authorities were unanimously in favour of an extension of the subsidy to larger houses, and he did not propose to ask the House to review the decision which it had already taken in regard to the size of the house.

Mr. Masterman asked the Minister whether he was prepared to submit additional Resolutions in Committee which would enable the House, if it so desired, to give power to the local authorities to build cottages of larger floor space than that now restricted by the Housing Resolution during the next 15 years if any of them so desired and to provide the owner-occupier with similar assistance to that now proposed to be offered to the local authorities for houses limited for letting purposes?

Mr. Wheatley said he had carefully considered these suggestions, and in view of all the circumstances could see no reason that would justify him in submitting another money resolution.

Bricklayers and Piece Work.

Mr. Wheatley, in reply to Mr. Hannon, said he was unable to say what number of bricks could be laid in a day by a bricklayer working piecework. It would be appreciated that the number of bricks laid would vary considerably with the class of work on which the bricklayer might be engaged. There were no records available which would enable him to give reliable figures as to average number of bricks laid per man on Government Housing Schemes.

Sir W. Davison: Does not the Right Hon. Gentleman know very well that in the work required in connection with the small Government houses it is only at the chimneys and the corners where there is any difficulty at all, and that it is perfectly plain sailing otherwise?

Mr. Wheatley: I am also aware that there are some men who could not lay the bricks for these houses.

Bricklayers' Wages.

Mr. E. Simon asked the Minister of Health whether he was aware that builders building subsidy houses in Manchester were paying up to 4d. an hour above the standard rate for bricklayers, with the result that the contractors who were building for the Corporation and paying the standard rate were getting so few bricklayers that one important contract would, at the present rate, take over 20 years to complete; and whether he would introduce legislation to prevent exploitation of this kind?

Mr. Wheatley said he was not aware of the rates of wages paid by the particular builders referred to, but if the scheme he had laid before the House was adopted he believed that the industry would be able to make such arrangements as would ensure a sufficient supply of labour for the local authorities' housing schemes.

Building Guilds.

Mr. Whiteley asked the Minister of Health whether he was prepared to meet representatives of the buildings guilds, prior to the present Housing Bill becoming law, with a view to securing their co-operation in the building of working-class houses?

Mr. Wheatley said that there had already been some discussion with representatives of the guilds and he had undertaken when the Housing Bill became law to consider the question of guild contracts in consultation with local authorities and the Industrial Committee which he proposed to set up.

Sir K. Wood: Is the Right Hon. Gentleman aware that all building guilds which have hitherto embarked on housing schemes have gone into compulsory liquidation?

Mr. Wheatley: I am not so familiar with their history as to enable me to agree with that statement. If that be so, it will be taken into account in the consideration of the matter.

Wooden Houses.

Mr. Mills asked the Minister of Health whether in view of the urgent and pressing need for houses and the proved success of wooden structures as a temporary measure, he would consider the possiblity of their immediate construction and allocation from a central factory for each area?

Mr. Wheatley said he was aware that wooden houses might be constructed in such a manner and with such quality of timber as would result in great durability and he was prepared to consider any proposals that might be made to him by local authorities for the erection of such houses. He did not, however, see his way to adopt the method of supplying them proposed.

Dwelling-houses or Factories?

In reply to Mr. P. Harris, who asked whether he was aware that in Bethnal Green owners of houses were getting possession of dwelling-houses and in spite of the housing shortage were converting them into factories; and whether he would consider legislation to prevent this?

Mr. Wheatley said he was aware that this had been done in certain cases, and he should be glad to consider any detailed information which may be brought to his notice. He had no hope of being able to deal with the matter this session.

Acquisition of Land.

Mr. Wheatley informed Mr. Ayles that he was not aware that local authorities generally had experienced difficulties in acquiring land for housing purposes. Local authorities already had power to acquire land for housing purposes notwithstanding that the land was not immediately required for those purposes and provision was made in the Housing Acts for the compulsory acquisition of land in cases where it was not possible to acquire it by agreement at a reasonable price.

An "Agricultural Parish."

Mr. E. Brown asked whether the civil or ecclesiastical area was taken as defining an agricultural parish under the Housing (Financial Provisions) Bill?

Mr. Wheatley said that it was proposed that the civil parish should be taken as the area for this purpose.

Office of Works Houses.

Mr. D. G. Somerville asked the First Commissioner of Works how many houses with a rent under £50 were owned by his department?

Mr. Jowett said that the number of such houses was 9,357, of which 106 are vacant, 82 being available for immediate reletting and the remaining 22 would also be relet if no satisfactory offers were received. His department was legally bound to endeavour to sell the houses on its housing estates, but any vacant house that could not be sold within a period not in any case exceeding eight weeks was immediately relet.

The Channel Tunnel.

The Prime Minister, replying to a number of questions, said that the question of the Channel Tunnel had been considered by the Committee of Imperial Defence. The Committee were unanimously of opinion that the advantages of the Tunnel were not commensurate with the disadvantages from a defence point of view, and the Government had no alternative but to accept the advice of the Committee.

NATIONAL FEDERATION OF HOUSE BUILDERS

We take the following extracts from a memorandum on the Housing (Financial Provisions) Bill, June, 1924, issued by the National Federation of House Builders:

"The Committee of the National Federation of House Builders, having examined the Housing (Financial Provisions) Bill now before Parliament, desires to draw attention to the effect which the Bill, if it becomes law in its present form, will have upon the future provision of houses for the working classes of the country.

"The Committee realises with regret that financial assistance is still necessary to encourage the erection of houses of a small type; and is convinced that stability to the trade can only be secured by the adoption of a fixed housing policy spread over a number of years. The assistance should be given with due regard to the effect it must have upon the eventual economic position of the housing industry, and it should also be designed to encourage the investment of private capital in house property. The assistance, again, should be afforded both to the poorer sections of the working classes and to those who can find a small amount of ready capital and are prepared to solve their own housing problem by investing their savings in a house for their own occupation.

"The Housing (Financial Provisions) Bill contains the concrete proposals of the Government for the future assistance of housing, and the Committee of the National Federation of House Builders regrets that the policy which has been so clearly outlined by the Prime Minister and the Minister of Health is not effected in the Bill, as it has been submitted to Parliament. The Committee desires to draw attention to important points on which the Bill fails to carry out the expressed intentions of the Government, and, in consequence, will do irreparable injury to the housing conditions of the country if it becomes law in its present form.

"1. *The restoration of confidence.*—The Housing, &c., Act, 1923 (Chamberlain Act) provided that the local authority should satisfy the Minister of Health that the housing needs of their area could more appropriately be met by the provision of houses by the authority themselves before they obtained his sanction to their own schemes. This resulted in the encouragement of private enterprise in most districts, and two-thirds of the houses built and building under the Act are private enterprise schemes. This clause is repealed by the new Bill, and Socialistic local councils will have a free hand to refuse assistance to private enterprise and to build houses themselves at double the cost to the public.

"2. *Assistance for houses for sale to the owner occupier.*—Although we have the assurance of the Minister of Health that the Bill "leaves intact the provisions of the 1923 Act, which gave a subsidy to private enterprise in building houses for sale," the clauses dealing with this particular point are ambiguous in the extreme, and if it is the intention of Parliament to continue this most valuable phase of the Government's housing activities, it should be made clear in the wording of the Bill. The future interpretation of the law will be based not on the expressed intentions of Ministers but upon the actual terms of the Act; this was proved by the famous Lumsden judgment, which changed the whole aspect of the land value clauses of the 1909-10 Finance Act, and led to their repeal, after doing enormous damage to the housing conditions of the people.

"Again, if it is the intention of the Government to extend the subsidy to private enterprise beyond the date fixed for its termination by the 1923 Act (October 1, 1925) it is by no means clear that the Bill carries this into effect. The Minister of Health has not stated that the subsidy is to be extended, as in the case of houses for letting, to October 1, 1939, and it would be manifestly unfair if the subsidy to one class of working people were to be withdrawn in 1925 while another class received assistance for a further period of 14 years.

"3. *The size of the houses.*—Although it is acknowledged that "not ten per cent. of the Addison houses are inhabited by the class of people whose needs must be solved" (Prime Minister, February 12, 1924) the Bill does not make any special stipulations for the erection by the local authorities of smaller houses than the 950 ft. house. The 950 ft. houses are not suitable for the lower paid working classes either in rents, which are too high, or in style, which is unsuitable, for they are generally built in pairs at about 12 to the acre. Unless some pressure is brought by Parliament on local authorities to build smaller types of houses in rows or terraces at 16 or 20 to the acre, there can be no amelioration of the housing conditions in the slums and the semi-slums of our large cities, and the inevitable effect will be that the poorer sections of the working classes will continue to be rated and taxed so that their better paid fellow workmen can be provided with houses at uneconomic rents. Although upwards of 200,000 houses were built under the Addison schemes at a heavy cost to the general public practically nothing has been done for those poorest wage earners who are least able to help themselves. The housing requirements of that section of the better-paid working classes who require the 950 ft. houses have been and are efficiently met by the Government houses already erected, and the subsidy to the owner occupier. On June 4 last, 141,065 houses had been approved by the Ministry of Health for assistance under the 1923 Act in the ten months since the Act was passed, and practically all of these houses are suitable only for the thrifty and better paid working classes. In the opinion of the Federation the whole activities of the local authorities in their own schemes should be directed to the relief of the poorest section of the working classes. If this is done every section of the working classes will receive fair and equitable help in their housing requirements.

"The Committee of the National Federation of House Builders desires to put forward the following suggestions as important principles which should be enforced if it is hoped to secure the most rapid production of houses from all available sources, and if the State-aided housing is not to destroy all private enterprise in the great business of housing the people.

"1. That the total subsidy which is to be applied by the local authorities in building houses to let to tenants should be available to the private builder who is prepared to build similar houses to be let at similar rents.

"2. The local authorities should fix a minimum rent for their houses at a figure which will show an economic return on the capital employed after allowing for the annual grant.

"The object of these suggestions is to render it possible for private capital to be attracted to housing, and for investors to return to housing as a favourite investment. House property is still one of the most stable of investments, and, as before the war, an annual sum of upwards of twenty millions sterling was found by the people themselves in building houses to be let to tenants, it is believed that, given a fair opportunity, large sums can be again secured in the same service.

"3. That the building schemes of local authorities for houses for letting should be limited to the provision of smaller types of houses built in rows or terraces at 16 or 20 to the acre, and that those requiring the larger types should be encouraged to buy for their own occupation.

"In some towns the houses built under previous schemes have been let to classes of tenants who are able to purchase their own houses, and who would do so if the local authorities' houses had not been available, while the schemes have provided practically no relief to the overcrowding in the poorer districts. It is suggested that the houses most required by those incapable of solving their own problems are houses of about 800 ft. floor area, and that by building in rows at about 16 or 20 to the acre the most economical and suitable type of construction can be achieved. By building the 800 ft. house at 20 to the acre, less than one-fourth of the land is built upon, and ample light and air is secured.

"4. That the subsidy to persons building or purchasing a new house for their own occupation not exceeding 950 ft. floor area should be continued and fixed at £100 in all cases, and that loans be made by the State or local authority to enable any person to purchase his house by finding ten per cent. of a fair purchase price, less the amount of the subsidy if the house does not exceed 950 ft.

"Every house built and sold to the owner-occupier is as much a contribution to the solution of the national problem as a house to be let."

NATIONAL HOUSING AND TOWN-PLANNING COUNCIL

We take the following from the fortnightly record of this Council:—

With the passing of the second reading of the Housing Bill and the decision to consider the measure in "Committee of the whole House," an issue of great importance presents itself for the consideration of Members of Parliament and the public generally. This issue relates to the measurements of the two-and-a-half million houses to be built under the Bill submitted to Parliament by Mr. Wheatley.

The Financial Resolution which was passed by the House of Commons before Whitsuntide governs the financial proposals of the Bill. Under this resolution it is provided that the measurements shall be those prescribed in the Act of 1923. The measurements thus referred to are given in sub-section (2) of Clause 1 of the Act (1923), as follows: 1. (2) The houses in respect of which contributions may be given under this section shall be either; (*a*) a two-storied house with a minimum of six hundred and-twenty and a maximum of nine hundred and fifty superficial ft.; or (*b*) a structurally separate and self-contained flat or a one-storied house with a minimum of five hundred and fifty and a maximum of eight hundred and eighty superficial ft.; such measurements being calculated in accordance with rules made by the Minister.

Provided that, if the local authority in any particular case satisfies the Minister that, having regard to special circumstances existing in their area, there is a need for houses of smaller dimensions, the minimum measurement may be reduced, as respects such limited number of houses for that area, and subject to such conditions as the Minister my determine, in the case of a two-storied house to five hundred-and-seventy, and in the case of a flat or a one-storied house, to five hundred superficial ft.

At the outset it should be noted that on cause being shown, the Minister of Health is empowered to allow the further reduction of the minimum measurement of a flat or one-storied house to 500 superficial ft., and further that the full subsidy of £6 per house for twenty years under the Act of 1923 is given in the case of these houses of reduced measurement. The same provision will moreover—unless amendments are carried—apply also to the new Housing Policy.

In other words, £9 per house for forty (40) years can be given by the Government in aid of the building of homes—if they deserve the name—with a minimum measurement of 530 super ft., with a possible further reduction to 500 super ft. Looked at from this point of view, there can be no doubt that a colossal blunder will be committed if the Bill is passed. Stated in another way, it is quite possible to add another 150 super ft. to the space of a house without greatly increasing the cost.

THE BUILDING TRADE

THE BUILDING TRADES DISPUTE

As announced in our columns last week, the Minister of Labour, having failed to bring about a settlement of this dispute, decided recently to appoint a Court of Inquiry to inquire into the causes and circumstances of the dispute. The employers thereupon resolved to postpone the lock-out notices for a week, but the men's leaders determined upon a stoppage of work last Saturday. Instead of a lock-out there is, therefore, a strike.

The Court of Inquiry consists of the Right Hon. Lord Buckmaster (Chairman), Mr. F. A. Hargreaves, J.P., Mr. Arthur Pugh. The secretaries to the Court are Mr. G. H. Ince and Mr. H. C. Emmerson, Ministry of Labour, Montagu House, Whitehall, S.W.1.

The terms of reference to the Court were:—

> To inquire into the causes and circumstances of the dispute in the building industry and to report on the facts in connection therewith, particularly with reference to the position in respect of hours in Scotland, London, and other areas, and to the strike in the Liverpool district.

The Court, it was stated, if not able to complete its investigation in the course of this week, might issue an interim report, in the light of which the parties would be able to reconsider the position. The employers stipulated that they should be at liberty to inform the public, by means of publication of the documents in the case, that it was consideration for the public interest—on which the Minister had based his plea for the avoidance of a conflict—that had induced them, without reciprocal engagements by the operatives, to defer the lock-out.

The operatives' disputes committee met and decided that work should not continue after Saturday last unless an advance of wages was conceded.

The offer made by the employers was in the following terms:—

> Upon the appointment of a Court of Inquiry, and in order to preserve a state of peace during the same, the employers will suspend their notices pending the report of such Court, provided that the operatives on strike at Liverpool and other places return to work immediately, and that the National Federation of Operatives suspend their other hostile actions against constitutional agreements pending the issue of such report.

The operatives' reply, communicated to the Minister, was:—

> Having seriously considered the statement and suggestion of the Minister of Labour, the National Disputes Committee decided that the Minister be informed that the National Federation of Building Trades Employers must unconditionally and unreservedly withdraw the lock-out notice decided by resolution of June 20, to become operative on July 5, preliminary to joint negotiations, failing which we are unable to discontinue our present activities to make arrangements with all those who are willing to carry on building trade operations.
>
> We insist that an advance of wages must become immediately operative, together with adequate provision for a guaranteed week. Finally, we feel that the employers' representatives must get fuller power from their organisation before they will be able to negotiate a settlement.
>
> With regard to the proposed public inquiry, the suggestion will be reported to a conference of the full executive councils which will meet in London early next week.

The employers' offer submitted to the Minister, with its attendant qualifications and conditions attached thereto, is made impossible of acceptance. The hostile attitude of the employers through the medium of the Press and by printed circular has created an atmosphere which tends to prevent calm consideration of the issues involved.

Further, we have no guarantee that the employers are able efficiently to discipline their members, who in many instances are to-day violating agreements entered into. The operatives still stand for the full honouring of agreements.

The employers' final intimation to the Minister of Labour was:—

> This National Allied Employers' Disputes Committee has carefully considered the reply of the Operatives' Disputes Committee to its well-meant and fair proposal, made solely in view of the request of the Minister of Labour that an endeavour should be made in the public interest to avert conflict throughout the building industry of Great Britain, and regrets to note that the tenor of the operatives' reply is hostile to that object.
>
> The Committee resolves that, in view of the Minister's definite statement that he intends to set up a Court of Inquiry immediately, and use all his influence to ensure the findings of that Court being published in eight days (July 10), and that the employers have freedom to publish the details of these interviews, the employers will postpone the posting of the notices till Friday, July 11, and to take effect on July 12, 1924.

In the course of a statement issued later the employers said:—

> The negotiating body for the employers represents the whole of their organisation throughout the country, including the subtrades, and nothing could give them fuller powers than they already possess. . . While realising that it is not within the power of the Ministry to put a term to the length of the inquiry, yet, in view of the fact that 5,000 men in the Liverpool area alone are on strike, and that there are strikes in other areas, and also in view of the concessions made by the employers in the public interest, the employers earnestly hope that an interim report, if not the report in its entirety, may be issued at such a time as will enable the postponed lock-out notices to be necessary.

The Disputes Committee of the operatives' federation made the following announcement:

> Notwithstanding the decision of the employers to postpone their lock-out notices from July 5 to July 12 under the guise of a public inquiry, which inquiry, when held, can decide nothing, we hereby resolve that we are unable to allow such a substitute to interfere with our previous position—namely, that on and from July 5 an increase of the hourly rate must take place, together with provision for a guaranteed week, failing which labour must be withdrawn.

Mr. R. Coppock, secretary of the operatives' federation, in a statement said that the Court of Inquiry could not effect a settlement, because the position had entirely changed.

> National negotiations are at an end, he said. Our members will now negotiate with the employers locally or regionally on the basis of the existing rates and a definite allowance for any loss of time for which the operatives are not responsible. We have proof that hundreds of employers are paying varying rates other than those nationally agreed upon, and the Employers' National Federation has taken no disciplinary measures against them. For the employers to talk now of the necessity for us to take disciplinary action is, therefore, preposterous.

When the Court of Inquiry opened last week the operatives were not represented. The Court therefore adjourned and acquainted the Ministry of Labour of the circumstance In the afternoon Mr. T. Barron, the president of the operatives' federation, stated there had been no intentional discourtesy. He and the secretary had been detained at a joint meeting of the executive councils of the trade unions and had arrived at the Court ten minutes after it had adjourned.

The full Disputes Committee of the operatives' federation was present in the afternoon but only to hear a formal protest made by Mr. Barron, on behalf of the joint executives, against the Court's terms of reference. The matters "particularly" mentioned were not, they said, in dispute, but had been settled. The question into which the Court should inquire was, they submitted, the repudiation of an agreement by the employers. Mr Barron complained that the reference bore no relation to the actual causes of the dispute and he stated that this fact debarred the operatives from taking part in the inquiry.

Lord Buckmaster, the chairman, put it beyond question that the Court had been set up to inquire into "every cause and every circumstance" of the dispute. The terms of reference were wide enough to permit the operatives to raise any grievance. The Court would have to report as to the matters particularly mentioned, and if it appeared that there was no dispute in relation to them, the report would be to that effect. He assured the operatives that (1) any grievance they brought forward would be fully investigated; and (2) that they could formulate in writing particular points on which they desired the Court's decision, and these would be given careful consideration. The employers followed with an assurance that they were in no way responsible for the terms of reference.

At a further meeting of the Court the operatives said they would be able to communicate the decision of the executive councils of their unions. The meeting was held and deputed Messrs. T. Barron, G. Hicks, A. G. Cameron, H. McPherson, W. Pickles, S. Taylor, and R. Coppock (the secretary) to represent the federation at the inquiry.

In regard to the strike, the position, it is stated, is that the men are officially demanding the immediate payment of a halfpenny an hour in addition to the rates at present in force, and compensation to the extent of half wages in respect of time lost through causes over which they have no control. There is, we understand, reason to believe that the men will be authorised to remain at work, in some areas at all events, if only the higher wage is paid. The demand will be presented to the employers, federated and non-federated.

A further meeting of the Federation of Building Trades Employers carried a resolution reaffirming the decision of June 20, which insisted on conformation to existing agreements as a condition of the resumption of negotiations with the operatives, but adding "except such negotiations as might tend directly to the healing of local breaches."

There are between 600,000 and 700,000 men in the industry, and their orders are, it appears, that they may remain at work when an advance of wages is given in accordance with the recent agreement, and a "guaranteed week" is conceded. The operatives believe that many employers will concede these terms, an idea that is rejected by the employers' representatives. At all events, the strike is a partial one so far, but there are no reliable figures to show how many men are out of work. The men's officials announce that municipal building will not be affected. Municipal employers are governed by a "fair wages" clause. At the first meeting of the Court of Inquiry Lord Buckmaster made an effort to prevent a stoppage of work, but unsuccessfully, the operatives stating that it was now too late and that things had gone too far.

Mr. Nicholls complained that the Operatives' Federation could not make their men keep an award or the decisions of the Wages and Conditions Council, and instanced this question of the 46½ hour week as an example. The burden of his case was the inability of the men's organisations to secure obedience to agreements, and his two chief examples were the Liverpool case and the hours question.

At the continuation of the Court of Inquiry on Monday Mr. R. B. Moss, on behalf of the Liverpool Building Trade Employers' Association, said he was authorised to state on behalf of his association that they would, to the fullest possible extent, earnestly co-operate to bring about a settlement of the unfortunate dispute. They would agree at any time to a conference of all interested parties. Whether there was a strike or a lock-out, both sides had in the end to rely on a round-table conference.

The Chairman remarked that was absolutely true, and the only difference was that if they had a conference at the end of a strike or lock-out one party came before the conference saying they were crushed by a force exerted on the other side. Strikes settled the justice of nothing. They only settled how long one side or the other was prepared to suffer. Proceeding, Mr. Moss said it had been contended that Liverpool had given away 4d. in a traitorous manner. He traced the history of the Liverpool Association and what led up to its expulsion from the federation. Two years ago representations were made to the association by both employers and operatives, and they again became members of the North-Western Federation and automatically members of the National Federation. Liverpool's contention was that if the meeting was arranged under a certain rule they would have committed themselves to local settlements.

Lord Buckmaster said the whole difficulty was Liverpool. If Liverpool were settled the whole thing would be settled. At the present moment Liverpool was in an acute state of reaction, and not prepared to settle. Surely Liverpool operatives must make up their minds to one of two things—they must either remain within the operatives' association or come outside.

After further discussion, Lord Buckmaster decided that the Court under its statutory powers would request leaders of the men in Liverpool, including Mr. Charles Wilson and Mr. Fyles, to attend the Court.

Mr. Thomas Ferguson (Scottish National Federation of Employers, and Scottish Allied Building Trade Employers), called by Mr. Nicholls and replying to Mr. Coppock, said that the employers in Scotland had not agreed to a 44-hour week. They had undertaken sympathetically to consider the proposal. Mr. Nicholls then said the position in Scotland was as acute as in Liverpool. It looked as if it was impossible of solution, but by joint efforts and by strengthening the national movements on both sides they had been able to effect a satisfactory settlement.

Mr. Holloway (managing director of Messrs. Holloway Bros., builders, and president of the London Master Builders' Association) stated that in 1920 a 44-hour week was instituted in the building trade. The employers did not regard that as final, and it was one of the points in dispute last year. By the award made by Sir Hugh Fraser, accepted by both sides, and embodied in the national agreement, a working week of 46½ hours was fixed for the summer time. The great majority of the men refused to work the 46½ hours. There was a good deal of passive resistance, and when the employers kept the works open until 5.30 in the evening the men left at 5 o'clock. The employers were anxious not to precipitate trouble and they acted with great forbearance and patience, and they wanted to have the matter referred to the Regional Joint Committee to sift the evidence. The men were supported in their refusal to carry out the award by the officials of their unions and advertisements were issued in the trade union papers urging the men not to work the 46½ hours which had been fixed.

Mr. Nicholls said that fewer hours were worked now than in 1913, and there was also a shortage of skilled men in the trade. The cost of output had no relation to the value. There had been an increase of 70 per cent.

Lord Buckmaster said they quite understood that if longer hours were worked the cost of building would be less, but how were they going to get the men to do it? It depended on the good will of the men who were working, and how could that good will be established and maintained?

Mr. Nicholls said that in 1914 the cost of plain, rough brickwork was from £3 10s. to £3 15s. per rod, while to-day it was from £9 15s. to £10 10s. The higher the wages the less the output.

Lord Buckmaster: Do you say that there has been a deliberate restriction of output?

Mr. Nicholls: Yes.

Lord Buckmaster: Then a man working 44 hours a week willingly does less work than if he is working 46½ hours unwillingly?

Mr. Nicholls said that the view taken by the men was that it was their duty to spin out the work, as by doing so they would create work for others and so decrease unemployment. It was no idle attitude that the employers had taken up, that the terms of this award must be obeyed. They were forced to do it as the provision of houses for the people was retarded owing to the enormous cost of building—a cost that was not warranted.

The case for the employers was then closed.

On behalf of the operatives, Mr. Coppock, who said he represented the views of 14 unions, opened the case for the workers. He said the cause of the unrest was entirely due to the desire of the employers to operate the law of supply and demand during the period that the industry was extremely slack, and they suggested the deletion of a clause in the agreement that dealt with the law of supply and demand. Now that the law of supply and demand was operating in their favour, continued Mr. Coppock, the employers did not desire to take any notice of its operation. They had accepted the situation for a period of three years when labour was not in demand; now that labour was in demand they were alleging breaches in the constitution of their organisation.

When the Court of Inquiry re-assembled on Tuesday, Mr. R. Coppock (on behalf of the men), said that the actual position at Liverpool to-day was that the men were getting exactly what they would have got if the sliding scale had been put into operation in its entirety.

The President, during a discussion, offered the suggestion that the two parties should come together with a view of arriving at a settlement of the dispute. Both the representatives of the employers and the men agreed to this course being taken.

Mr. Nicholls, in his final address, said if they gave the extra penny it would mean the expenditure of over six millions a year and add to the rent of the workers' houses by between 5½d. and 6d. per week.

In concluding the conference, Lord Buckmaster said that he had been impressed with the constant expression of good feeling shown by both sides. He reiterated his appeal to the parties to come together.

We take the following extracts, in connection with this dispute, from a document issued by the London Master Builders' Association:

> With regard to the dispute, it is apparent that the bulk of the operatives are quite ignorant that the employers' final offer made on May 14 last clearly stated that it was subject to a termination of the deliberate breaches by the operatives of the national working rule agreement, and specifically mentioned the refusal of the men to work the extended summer working hours, the embargo on overtime and the refusal of the operatives in different parts of the country to honour the national agreement.
>
> This ignorance has undoubtedly arisen because the ballot papers issued to the men by their unions did not contain any reference whatever to this essential condition in the employers' offer.
>
> Apart from sectional strikes, the members of this association are seriously concerned with regard to the question of the summer working hours and overtime.
>
> In regard to the former the agreed working rule (based on the award of Sir Hugh Fraser) provides for a 46½ hour week during summer time. Whilst the employers are loyally honouring the national agreement, sections of the operatives have refused to work the longer summer hours.
>
> Since the demand for "another 2d." arose the operatives have employed every means to retard progress, and to foment trouble in the industry. Their action in regard to overtime is a noteworthy example. The rules provide for overtime, and there are restrictions very properly introduced to prevent systematic overtime during periods of severe unemployment. In the masonry and plastering trades particularly very serious delays are being caused in the completion of important works. It is admitted by the unions every mason is in employment, but they refuse to admit any urgency or allow their operatives in this or any other trade to work overtime. Clients are being made to suffer in consequence of this action quite as much as the employers. Contracts are taking longer to execute than they should and building owners are sustaining heavy losses. Despite the fact that these circumstances have been very strongly represented, the unions refuse to alter their attitude, which is totally opposed to the spirit of the national rules.
>
> It cannot be emphasised too strongly that the London employers are supporting the national lock-out solely with the object of preserving the sanctity of agreements, as although the breaches in London are at present restricted to non-observance of the national rules relating to working hours and overtime there can be no doubt that if the men in any locality are allowed to achieve their object of obtaining enhanced rates of wages by resorting to strikes such lawless action will spread throughout the country.
>
> The experience of contractors during the past six months is almost unanimous to the effect that output is being restricted, and they are constantly confronted with interference and tyranny from the responsible officials and delegates of the unions.
>
> N.B.—The operatives in London and other parts of the country have now demanded, as terms of settlement, an advance of 2d. per hour, a 44-hour week throughout the year, and payment for time lost through stress of weather.

We have received from Messrs. Bovis a short account, which we give below, of their opinion of the present situation:—

> Although during the past few months Messrs. Bovis Ltd. have resigned from the Employers' Federation, they have decided to support that body pending further information on the matters in dispute.
>
> Referring to these, they express the view that the employers are attaching far too much importance to the slightly extended number of hours, instead of attacking the more serious problem of the output which the men are giving whilst they are at work.
>
> The arrangements which their company suggest in respect of this, would operate to the advantage of the industry, and at the same time afford the men the security they demand.
>
> The firm has some sympathy with the demand of the men in respect of the loss of "wet time" at present suffered by them.
>
> Their suggestion to overcome this is the formation of a scheme whereby the very small amount of a fraction of a penny per day per man, and an equal allocation by the employer would provide sufficient to pay a full week's wages to all operatives in inclement weather.

COPPER AND BRASS FOR DOMESTIC WATER SERVICES

THERE is no doubt that the popular conception of copper as a material of construction is directed exclusively towards those cases where money is no object. For water services, in particular, we should all fit out our castles in the air with copper pipes and tanks, but for the everyday job we have not dared to consider the project, and the bar has been entirely one of imagined cost. If we could be sure of a material that will not corrode, will not dissolve poison into the water, is strong enough to resist the expansion of freezing water, and will recover after the frost, is sufficiently "sightly" to run exposed without ugly casings and inconvenient diversions into cupboards and corners, and is at the same time no more costly over the more generally used materials than can be justified by the saving in maintenance, then we should certainly find such a material in daily and universal use. If copper can supply these requirements, then it must be our ignorance and the natural corollary thereof—our prejudice—that has barred the way to such a desirable practice, and the way to dispel it is by propaganda. The Copper and Brass Extended Uses Council has undertaken the task in a very able manner that bids us welcome their little brochure on "The Use of Copper and Brass for Domestic Water Services." This little book is frankly admitted as in the interests of several of the associations of non-ferrous metal manufacturers, and is very tastefully presented and printed, with clear illustrations in the form of working drawings and data. It carries us through the line of argument that points out the many advantages that copper holds over other materials in the installation of domestic water services. Most of these advantages are generally known and accepted, but the matter of relative cost is dealt with so openly in the actual figures of experience set down in a way that is a direct challenge to the sceptic, that the average reader can hardly fail to accept them and their findings. We are given the relative percentage costs upon that of a small municipal house, between iron, lead and copper as 7.2, 9.4 and 9.6 respectively, and still more favourable comparisons in work of larger scope. Apply these figures to a £600 house and we find an all-copper installation costing only about £14 more than one all in galvanised iron, and only slightly more than one all in lead. We look forward to the opportunity of testing the project in actual practice, and we congratulate the body concerned upon the able and conclusive way in which they have presented their case.

LEAD PAINTS

Messrs. White & Leonard, solicitors, writing with reference to the Lead Paints (Protection against Poisoning) Bill, which came on for second reading in the House of Commons on June 20, inform us that strenuous opposition from both the Liberal and Conservative side was offered to the part of the Bill which proposes prohibition (*i.e.*, the prohibition of the use of white lead for interior painting), while there was general acceptance of the part which provides for regulations and particularly regulations to prohibit the dry rubbing down of paint. The Under-Secretary for Home Affairs sought to represent that there would be a breach of honour and a betrayal if the House did not ratify the Geneva Convention, but the Home Secretary had to disavow this as merely a flight of Welsh eloquence. The letter continues: "It was obvious that if it were pressed to a division the Bill was likely to be defeated, and so not only the opposed Prohibition part, but also the generally-accepted Regulation part, would have been killed. The Home Secretary therefore gave an undertaking that if the second reading were allowed and the Prohibition part were knocked out in Committee, he would not withdraw the Bill, but allow it to become one for Regulations only; and this was agreed without a division."

RATES OF WAGES IN THE BUILDING TRADE.

The following are the rates of wages in the building trade in England and Wales. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Bricklayers.	C'p'ters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Labourers.
Aberdare	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Accrington	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Altrincham	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Ashton-under-Lyne	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Barnsley	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Barrow-in-Furness	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Barry	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Bath	1/5½	1/5½	1/5½	1/5½	1/5½	1/5½	1/5½	1/1½
Bedford	1/5	1/5	1/5	1/5	1/5	1/5	1/5	1/0½
Birkenhead	1/9	1/9	1/8½	1/9	1/9	1/9	1/8½	1/4
Birmingham	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Bishop Auckland	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Blackburn	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Blackpool	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Bolton	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Bournemouth	1/5	1/5	1/5	1/5	1/5	1/5	1/5	1/0½
Bradford	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Brentwood	1/5½	1/5½	1/5½	1/5½	1/5½	1/5½	1/5½	1/1½
Bridgwater	1/4	1/4	1/4	1/4	1/4	1/4	1/4	1/0
Brighton	1/5	1/5	1/5	1/5	1/5	1/5	1/5	1/0½
Bristol	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Burnley	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Burton-on-Trent	1/6½	1/6½	1/6½	1/6½	1/6½	1/6½	1/6½	1/2
Bury	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Cambridge	1/5	1/5	1/5	1/5	1/5	1/5	1/5	1/0½
Cardiff	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Chatham	1/5	1/5	1/5	1/5	1/5	1/5	1/5	1/0½
Chelmsford	1/5	1/5	1/5	1/5	1/5	1/5	1/5	1/0½

(For rates of wages in the Building Trade in Scotland, see page 74.

CONTRACTS, COMPETITIONS, &c.

Forsome contracts still open, but not included in this List, see previous issues. Those with an asterisk re advertised in this number. Certain conditions beyond those given in the following information re imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any nder; that a fair wages clause shall be observed; that no allowance will be made for tenders: and iat deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names those willing to submit tenders, may be sent in; the name and address at the end is the person from whom place where quantities, forms of tender, &c., may be obtained.

The Principal, Science and Art School and Technical Institute, Kingston Hall-road, Kingston-upon-Thames.

Sir Alfred Yarrow's Offer Rejected.

The Improvements Committee of the Westminster City Council report as follows:—

"Sir Alfred Yarrow has submitted to us a model and drawing showing the proposal from which it would appear that the proposed elevated crossing would have a length of about 680 ft. and a width of about 21 ft. 6 in., and would extend from the eastern end of the Wellington Monument island site, opposite Apsley House, to a point 100 yds. westward along Knightsbridge. Mr. Bassom, Chief of the Traffic Branch of the Metropolitan Police, attended our meeting. We have given the proposal our careful consideration and in view of the interference with private property, the partial obscuration of the entrance to Hyde Park, and general objections likely to be raised from an æsthetic point of view, as well as other difficulties, we are unable to recommend that Sir Alfred Yarrow's offer be accepted. The Works Committee on June 17 concurred in the views of the Improvements Committee.

PROPOSED NEW BUILDINGS & OTHER WORKS

IN these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations: T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; B.C. for Borough Council; P.C. for Parish Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; and B.E. for Board of Education.

ACCRINGTON.—The B.S. has been requested to submit an estimate of the cost of providing an additional entrance to Haworth Park from Manchester-road. Plans have been approved of a house in Laund-road for Councillor Constantine, a house in Claremont-road for Mr. W. Ramsbottom, bungalows in Mosshall-road for Mr. J. W. Dean, and a semi-detahced house in Claremont-road for Messrs. Tasker & Greenwood.

ALNWICK.—Plans have been prepared for a new wing at the Alnwick Infirmary, at an estimated cost of £1,500 to £1,600.—The M.H. has approved of the houses proposed to be erected in the U.D.C. area by private enterprise.

ASHTON-UNDER-LYNE.—The proposed alterations and extensions to the Littlemoss C.E. School came before the members of the District E.C.; it was decided to forward them to the B.E. It was stated that the land had been given by the owner for the extension as well as sufficient on which to build a church, and the cost of the alterations and extensions has been raised.

AUDENSHAW.—The Wilshaw Chemical Co. have acquired a house and land at Haughton-road as a site for extensions to their works.

AYR.—The Dean of Guild Court has passed the following plans: Ayr T.C., to erect 66 houses in St. George's-road, estimated cost £14,000; Quintin Clark, builder, three shops, at Tam's Brig; A. Dunlop, 28, St. Leonard's-road, bungalow in Robsland-avenue; William Clarke, builder, bungalow in Clarke-avenue; J. & D. Meikle, builders, house at Bellvale-avenue; Q. Clark, double cottage in Bellesleyhill-avenue.

BANGOR.—The T.C. are proposing to adapt the old buildings of the Snowden Flake Flour Mills, Dean-street, as an electrical engineering laboratory. They have also been recommended to increase the hostel accommodation for provision for additional students to the College.—The C.C. are recommended to purchase nearly 10 acres of land from the Penrhyn Estates for £2,720 for a new cemetery, and to apply for sanction from the M.H. to borrow £5,300, the estimated total cost of the land and lay-out.

BILLINGE.—Plans have been approved for erection of two houses in Orrell-road and house in Upholland-road.

BIRKENHEAD.—Proposals are to be considered by the T.C. for the erection of a new art gallery, on a site opposite the Central Station. The cost, including new roads and alterations to the existing thoroughfare, is estimated at about £90,000.——The Warehouse Committee of the Mersey Docks and Harbour Board are proposing to erect a warehouse with wooden floors.

BIRMINGHAM.—The Franciscan Fathers at the Monastery, Olton, are proposing to erect a church on an adjoining site, estimated to cost £10,000.

BLACKBURN.—The application of Canon Sinker, R.D., for permission to erect a stained glass window in the Church of England Chapel at the cemetery has been granted by the Corporation, subject to the work being carried out to the satisfaction of the Borough Engineer. The Borough Engineer has prepared a plan for the lay-out of the Parish Church Yard, which has been referred to a Corporation Sub-Committee.

BLACKPOOL.—The E.C. are proposing relaying the floor of the Secondary School with wood blocks, and are to decorate and paint various schools in the districts. Tenders are to be invited. The Talbot Central Agency is proposing to erect houses on a site at St. Anne's-on-Sea.

BOLTON.—The Committee of the Rumworth and Hulton Labour Club are proposing to considerably extend their premises, estimated to cost £400.

BOURNEMOUTH.—Plans passed by T.C.: Conversion into flats, "Belle Vue," Beaufort-road Mr. S. Adams; two houses, Southbourne-Overcliffedrive, Messrs. Bunning & Patrick; house, Grove-road, Mrs. Fane; house, St. Ledger's-road, Mr. C. V. Miller; house, Highfield-road, Mr. S. Hawkins; two houses, Harewood-avenue, Messrs. Midgley & Hardy, Ltd.; house, 5, Branksome Wood-road, Mr. J. Small; house, St. Luke's-road, Mr. A. Barnes; house, Boscombe Cliff-avenue, Mrs. H. D. Jackson; two houses, Beaufort nad Burleigh-roads, Messrs. H. B. & E. Mudge; conversion into flats, 7, Grand-avenue, Mr. Wyatt; house, Ravine-road, Mr. R. J. M. Nabney; house, Charminster-avenue, Mr. B. E. Crowe; three houses, Castlemain-avenue and Inverleigh-road, Mr. T. O. Barrett; house and garage, Ravine-road, Messrs. E. M. Drewitt & Co.; house, Southill-road, Mr. E. T. Payne; two houses, Harewood-avenue, Messrs. H. B. & E. Mudge; house, 21, Bishop-road, Mr. B. Godfrey; house, St. Luke's-road, Mr. C. H. Belbin; house, St. Luke's-road, Mr. A. Barnes; house, Eldon-road, Mr. J. H. Roberts; two houses, Withermoor and Sedgeley-roads, Mr. A. E. Hoare; house, Inverleigh-road, Mrs. Hewitt; house Kemp-road, Mrs. Ferrer; conversion into two flats, "Westdene," Pinecliffe-avenue, Mrs. F. McLaughlin; house, Portland-road, Mr. J. Dommett; house, Norton-road, Mr. Weston; house and garage, Queen Park avenue, Mr. F. J. Finlinson; house, Kimberley-road, Mr. Hayes; house, Pickford-road, Mr. Westcott; two houses and garages, Cecil Hill, Miss M. Saunders; house, Carbery-avenue, Dr. A. H. B. Hartford; house and garage, corner of Namu and Mansfield-roads, Messrs. Burt & Son; house, Elmes-road, Mr. A. E. Rockett; bungalow, Westfield-road, Mr. E. Broughton; bungalow, corner of Charminster and Strouden-roads, Mr. Carpenter; house, King George-avenue, Mr. F. E. Billett; two houses, Bloomfield-avenue, Mr. G. Cooke; house, Portland-road, Mr. F. Jeans; house, Albemarle-road, Mr. T. R. Stevens; bungalow, Southbourne Overcliffe-drive, Messrs. Whiting & Edmunds; house, Tennyson-road, Messrs. Way & Marshall; bungalow, Rowena-road, Mr. G. Street; house, Danesbury-avenue, Mr. E. Walker; house, corner of Boscombe Overcliffe-drive and Ravine-road, Mr. R. J. M. Nabney; house, De Lisle-road, Mr. Franks; house, Pickford-road, Mr. G. Jones; two houses, Rowena-road, Mr. T. Sutcliffe; bungalow, Danesbury-avenue, Mr. A. E. Spruce; rebuilding of premises, 134, 136 and 138, Old Christchurch-road, The Bournemouth Gas and Water Co.; house, Danesbury-avenue, Mr. S. Thomas; house, Castlemain-avenue, Mr. E. G. Stay; two houses, Tuckton-road, Mr. W. A. Crosby; house, Eldon-road, Mr. W. H. Light; house, Dingle-road, Mr. J. Newbury; two houses, Watcombe-road, Mr. C. B. Philpot; three houses, St. Luke's-road, Mr. W. Moore; house, Clarence Park-road, Mr. A. R. Barnes; house, St. Luke's-road, Mr. C. H. Belbin; two houses, Southbourne Overcliffe-drive, Messrs. Midgeley & Hardy; two pairs of semi-detached houses, Southbourne Overcliffe-drive, Messrs. Midgeley & Hardy; house, De Lisle-road, Mr. Edgeley; three shops and two flats, corner Holdenhurst and Richmond Park-roads, Mr. S. Gidlow; three houses, Grange-road, Messrs. Golton Bros.

BRADFORD.—In connection with the construction of Scar House reservoir, it is now proposed to enlarge the capacity by raising the tap water level, at an additional cost of £90,000.

BRECON.—The County War Memorial Committee is to proceed with the erection of a new County Hospital, on a site near Brecon.

BRIDGEND. — The U.D.C. is to present to the Glamorgan C.C. alternative schemes of a 40 and 50 ft. widening of the Tondu-road, by the joint action of the two authorities.—Plans passed by U.D.C. are as follows: Two houses at Brynteg, for Messrs. Wardlow & McDonald, Bridgend; house for Mr. Rhys Williams, at Grove-road; house, at West-road, for Mr. O. Walters Rees, Bridgend; bungalow at Llangynydd-road, for Mr. William Johnson, Bridgend.

BURNLEY.—The R.D.C. have received sanction from the M.H. to borrow £5,000 for the purpose of grants under the Housing Act. A memorial, to take the form of an oak panelling round the sanctuary, with a carved and canopied sedilian, is to be placed in St. Margaret's Church, estimated to cost £300.—Plans passed by T.C.: Warehouse, Barnes-street, for R. Parkinson & Sons.——With a view to the erection of further houses the Corporation are ascertaining the needs of the township.

BURY.—The Bury and District Joint Board are proposing to erect a motor garage and petrol shed at the Florence Nightingale Hospital. Plans have been approved for the erection of two shops in Stanley-street for Mr. J. Clegg. The Tramways Committee recommended that an "Umbrella" shelter be erected in the centre of the Market Place.

CARDIGANSHIRE.—The B.G. proposes to alter and extend the accommodation at the Altso Castle Institution, at an estimated cost of £4,000.—The County Small Holdings Committee will shortly invite tenders for work required to be done at Gelmast.

SOUTHWICK.—The U.D.C. are to erect 30 houses by private enterprise. Sanction has been obtained from M.H. The surveyor has been instructed to prepare plans for 90 more.

SPALDING.—The U.D.C. are making application for sanction for a loan of £70,000 for the purpose of constructing new sewage works.

SPENBOROUGH.—Plans passed: House and shop at Norristhorpe-lane, Liversedge, for Messrs. G. C. & H. A. Hoyle.

STALYBRIDGE.—The T.C. has approved plans involving the demolition of condemned cottages and alterations and improvements to the "Old Fleece Hotel," belonging to John Smith's Tadcaster Brewery Co., Ltd.

STOCKTON.—The T.C. proposes to abolish the slum area on the riverside, the intention being to provide on the site a municipal lodging house, a workingmen's club, 28 houses, two open spaces, sites for building of an industrial character, and a street from Hunter's-lane to Bishop-street. To provide for the re-housing of residents in the area, it is proposed by the Housing Committee to erect 164 houses. These, it is recommended, should be built at St. Ann's Hill, Portrock.—The Housing Committee is considering the advisability of utilising 9 acres of Grangefield Farm site for the erection of a portion of the 300 houses the Corporation is to build, in addition to those for rehousing.

STRETFORD.—Plans passed by U.D.C.: Eight houses, Talbot-road, for Messrs. Geo. H. Brown & Son; two houses, Edge-lane, for Mr. Arthur G. Langshaw; eight houses, Gorse-lane (subsidy), for Messrs. Geo. H. Brown & Son; shop, Moss-road, for Manchester & Salford Equitable Co-operative Society, Ltd.——The D.C. have instructed Mr. P. Howard, architect, of Manchester, to prepare plans, together with the elevations and sections, and draw up specifications for the erection of a new school at Gorse Hill, for submission to the B.E.

SUTTON COLDFIELD.—Plans passed by T.C.: Four houses, Boldmere-road, for Mr. A. P. Johnson; four houses, Chester-road, for Mrs. Durban; house, Chester-road, for Mr. F. H. Andrews; house, Chester-road, for Mr. S. Morris; house, College-road, for Mr. D. G. Mackintosh; house, Four Oaks-road, for Mr. M. E. Steeley; house, Four Oaks-road, for Miss Glover; house, Four Oaks-road, for Mrs. Glover; house, Four Oaks-road, for Mr. F. Retallack; house, Green-lanes, for Mr. J. B. Willetts; bungalow, Jordan-road, for Mrs. E. M. Richmond; house, Ladywood-road, for Mr. W. J. Gold; house, Ladywood-road, for Mr. C. Macbeth; house, Mere Green-road, for Mr. H. E. Williams; bungalow, Rectory-road, for Mr. J. Pickering; pavilion, off Tamworth-road, for Congregational Recreation Club; bungalow, Vesey-road, for Mrs. Eldred; two bungalows, While-road, for Mr. G. H. Lawley; house, While-road, for Misses Kane and Lloyd; eight houses, Walmley-road, for Mr. A. P. Johnson.

SWANSEA.—Plans passed by T.C.: Two houses, Eversley-road, for Messrs. T. & G. Spragg; bungalow, The Mayals, for Mr. A. Puddicombe; two houses, new road off Newton-road, for Messrs. W. & T. Beynon; conversion into flats, 133 and 135, Bryn-road, for Mr. H. Roberts; two houses, West Cross-lane, for Mr. A. V. Hopkins; house and shop, Pleasant-street, Morriston, for Mr. D. Francis; house, Cecil-street, for Mrs. E. D. Hammett, house, West Cross-lane, for Mr. W. J. Saunders; two houses, Rivers-lane, West Cross, for Messrs. D. & B. Rees; house, Mumbles-road, Blackpill, for Mrs. Nordoff; bonded store, Church-street, for the Swansea United Breweries Co.; masonic hall, St. Helen's-road, for the Masonic Hall Co.; two houses, Caswell-road, for Mr. Edwin Davies; house, Wayn-Wen-road, for Mr. E. Waters; two houses, Sketty-road, for Mr. Rees Jones; bungalow, Tycoch Estate, for Mr. R. Schenk; house, Tycoch Estate, for Mr. J. P. Row; house, Tycoch Estate, for Mr. A. J. Downer; house, Tycoch Estate, for Mrs. A. G. Downer; house, Tydraw-road, for Mr. Jos. Jones; house, Tydraw-road, for Mrs. Eliz. Davies; two houses, Tycoch Estate, for Mr. Chas. Evans; four houses, new road off West Cross-lane, for Mr. Hy. Beynon; two houses, Tycoch Estate, for Mr. F. A. Morris; house, Rivers-lane, West Cross-lane, for Mr. W. J. Ferrer; house, Rivers-lane, West Cross, for Mr. B. Rees; two houses, Cecil-street, for Mr. J. O. Watkins; three houses, Clare-street, Manselton, for Mr. John Jewell; bungalow, Whitestone-lane, for Mr. Dd. Davies; two houses, Middle-road, for Mr. J. Ll. Davies; two houses, Middle-road, for Mr. Emrys Thomas; two houses, Riversdale-road, Norton, for Mr. A. B. Beer.

SWINTON BRIDGE.—Two schools are to be enlarged, each by 50 places, at a cost of £1,200 each.

TADCASTER.—Plans passed: Two houses in Station-road, Scholes, for Messrs. J. H. Stockdale and A. Todd; house in Owlett Hall-lane, Kippax, for Mr. E. Hough; two houses in Carlton-terrace, Allerton Bywater, for Messrs. H. & F. Miller; two houses in Carlton-terrace, Allerton Bywater, for Messrs. H. Rhodes and J. Rushton; house, Carlton-avenue, Allerton Bywater, for Mr. Arundel Thompson; two houses in Barwick and Scholes-road, for Mr. Wm. Smith; and a bungalow, Station-road, for Mr. C. Steel.

THORNE.—An inquiry has been held by the M.H. into an application by the R.D.C. for powers to borrow £28,000 for works for the disposal of sewage at Hatfield.—A secondary school is to be erected at an estimated cost of £25,000.

THORNTON.—The D.C. are to apply to the M.H. for approval for subsidies for a further 30 houses.

THURCROFT.—Accommodation for 500 children is to be provided, at a cost of £11,000.

TODMORDEN.—An engineering laboratory is to be provided at the technical school, at a cost of £700.

TROWBRIDGE.—Plans passed by U.D.C.: Bungalow, Bradley-road, Mr. C. H. Goater, for Mr. A. Wiltshire; bungalow, Bradley-road, Mr. Goater, for Mr. S. J. Wood. The U.D.C. proposes to invite tenders for repairs and decorations to the Council Chamber. It has been decided to complete the housing scheme on the Gloucester-road Estate. The Surveyor is to prepare a sewerage scheme for the Silver-street farm estate, which is now being rapidly built upon. It is proposed to obtain a loan of about £5,000 for road and footpath renovating.

WAKEFIELD.—The West Riding C.C. E.C. propose to build new elementary schools at the following places:—At Armthorpe, with accommodation for 1,000 scholars, at an estimated cost of £23,000; at Bentley-with-Arksey, for 300 scholars, at an estimated cost of £7,000; at Castleford, Temple-street, for 350 scholars, estimated cost £7,000; at Glasshoughton, on the Airedale Estate, for 550 scholars, at an estimated cost of £13,000; at Hirst Courtney, and Temple Hirst, for 100 scholars, at an estimated cost of £2,500; at Saddleworth, for 250 scholars, at an estimated cost of £5,500; at South Hiendley, for 450 scholars, at an estimated cost of £5,200; at Swinton Bridge, Roman-terrace Council, for 50 scholars, at an estimated cost of £1,200; at Thurcroft, for 500 scholars, at an estimated cost of £11,000; at Woodsetts, for 200 scholars, at an estimated cost of £5,000; and at Saddleworth Uppermill, for 120 scholars, at an estimated cost of £4,800.

WARRINGTON.—Plans passed by T.C.: Three houses, Orford-avenue, for Messrs. W. & A. Ashton. Old buildings near the bridge are to be demolished to provide a site for the war memorial. The Council is considering the lay-out of the site of the Old Bridge Inn. The borough surveyor has prepared plans showing the course of the proposed road from Manchester-road to the River Mersey at Howley. It is proposed to erect three houses for the fire brigade on land in Cambria-place.

WATERFOOT.—An enquiry is to be held by the B.E. into the proposal to convert Lumb C.E. School into a juniors school and transfer the senior scholars to a contemplated new school at Edgeside.

WEST RIDING.—The C.C. has prepared a scheme, to cost £88,774, for new office accommodation, stores and garage, at Wakefield.

WHARFEDALE.—The M.H. has held an inquiry into the R.D.C. application to borrow £15,000 for the purpose of carrying out improvements to the sewage disposal works.

WHITBY.—Plans for sewage disposal work by Messrs. Radford & Son, Nottingham, costing about £26,000, have been submitted to the M.H. for approval.

WHITWOOD.—A scheme for the widening of the main road from the Four Lane Ends to Cutsyke. The plans have been submitted to the W.R.D.C. for their approval.

WIMBLEDON.—Plans passed by B.C.: Mr. A. W. T. Richards, four houses, Worple-road; Mr. F. H. Skeens, 31 houses, Durnsford-road; Mr. W. H. Bateman, house, Wimbledon Hill-road; Messrs. W. H. Whitehead & Co., house, Mount Ararat-road; Mr. J. Bowen, for electricity sub-station and four lock-up garages, Grove Road-mews; Mr. J. Browne, five houses, corner of Albany-road with Gap-road; Mr. E. J. Shelmerdine, rebuilding mess-room at Wimbledon Laundry, Cranbrook-road.

WINCHESTER.—A new church is to be erected by the R.C. congregation on a prominent site.

WOLVERHAMPTON.—Plans passed by T.C.: F. W. Holland, two houses, McBean-road; H. Patton, two houses, Compton-road; T. Mackie & Son, two houses, Richmond-avenue; M. K. Wells, house, Bruford-road; G. J. Peck, house, Claremont-road; A. J. Stevens & Co. (1914), Ltd., enamelling and polishing shop, Graiseley Hill; W. Withers, 24 houses, Fowler-street, &c.; W. Rowley, house, Goldthorn Hill-road; R. & G. Knowles, Ltd., joinery works, Hickman-avenue; M. Burton, Ltd., shop premises, Dudley-street; W. Nicholls, shop, Dunstall-road; A. J. Stevens & Co. (1914), Ltd., additions to works, Lower Walsall-street.

WOODFORD.—The U.D.C. proposes to establish a depot and store yard on land at the sewage works.—Plans passed: Houses and new road, South Woodford; house, Monkham's-drive.

WREXHAM.—Further additions and improvements are to be made to the new hospital which include a pathological laboratory, a laundry, an operating theatre, a mortuary, and alterations to two adjoining buildings, estimated to cost about £11,000.

YORK.—The York Sites Sub-Committee propose to provide lavatory accommodation at Nunthorpe Secondary School, at a cost of £1,250.

Fire.

Damage estimated at between £70,000 and £80,000 was caused by a fire which broke out early recently in the premises of Messrs. Albert E. Mallandain, Ltd., printers and manufacturers of corrugated paper, Clerkenwell, London.

NEW BUILDINGS IN LONDON

St. Marylebone.—EXTENSION.—The St. Marylebone Borough Council is carrying out an extension of the boiler house at its electricity generating station, Richmond-street, Marylebone. The building is a steel-framed structure with the permanent end next the Regent's Canal filled in with brickwork faced with "New Heather" bricks. The contractors for the main concrete and building work are Messrs. Ashby & Horner, Ltd. The steelwork is provided and erected by Messrs. Sanders & Forster, Ltd. The boilers and their steel chimneys and the crane are being installed by Messrs. Babcock & Wilcox; the pipe work by the Brightside Co., the ash-handling plant by the Underfeed Stoker Co., Ltd., and their sub-contractors (Messrs. Peter Lind & Co.); and the cooling towers, &c,. by the Clyne Engineering Co. A further extension on the eastern side of the station is being erected for the Administrative Section. This building is also a steel-framed structure, with brick enclosing walls. The general contractor is Mr. A. E. Symes. The steelwork is being supplied and erected by Messrs. Smith, Walker, Ltd. The Borough Council's electrical engineer (Mr. C. H. Smyth) and his chief assistant (Mr. F. B. Leonard) are dealing with the engineering and equipment work; and Mr. H. T. A. Chidgey, M.S.A., is responsible for the building operations.

Park Royal.—HOSPITAL.—The Park Royal Hospital, Willesden, is now being erected. The building is of the usual construction, stock and red brick facings, and slate roof. The steelwork has been sublet to Messrs. Measure Bros. (1910), Ltd. Messrs. F. R. Hipperson, Ltd., of Trowse, Norwich, are the builders. Messrs. Saxon, Snell & Phillips are the architects; and the quantities are by Messrs. Northcroft, Neighbour & Nicholson.

New Labour Guild.

The Amalgamated Union of Building Trade Workers has for some time had under consideration a direct Labour Guild by which it is proposed workers will, through their own organisation, contract for the building of houses. It is on the lines of the mediæval guilds, and is intended to have the effect of eliminating the profits of the middleman. The Liverpool Housing Committee already propose to build twenty-four houses at Woolton by direct labour, and negotiations are on foot between the Committee and the newly formed Guild for the contract.

A Concrete Exhibit at Wembley.

The Concrete Utilities Bureau, of 35, Great St. Helens, London, E.C.3, has a stand at Wembley containing an extensive collection of exhibits illustrating the application of concrete to what may be called its minor uses. The architect for the stand —which is No. 25 in the Horticultural section—was Mr. Clough William-Ellis. The stand is 140 ft. long and 40 ft. wide, and is practically an all-concrete structure in the classic style ornamented by plaques designed by Mr. Gilbert Bayes, the sculptor. Externally the concrete is untouched. Internally the walls exhibit some dozen or so panels illustrating the various artistic methods of surface treatment. In front of the pavilion is a section of concrete road. On the eleventh day after placing the concrete it sustained, undamaged, traffic amounting to 1,000 tons.

The office—which is really part of the building—is of cast stone made to imitate Ham stone. Another example of this character is a screen consisting of three arches. This is made to represent grey Doulting stone. Visitors to the stand will see examples of the use of concrete in many interests—architects and builders, the estate and farm, the railway, public authorities, the home and garden and others. In addition to the stand itself are shown examples of concrete building systems, tiles, windows, walling and cast stone.

PRICES CURRENT OF MATERIALS

[Owing to the exceptional circumstances which prevail at the present time, prices of materials should be confirmed by inquiry.—Ed.]

Builder's Estate.

Mr. William Pryor, of 1, Gresham-road, Cambridge, lately chairman of William Pryor & Co., Ltd., wholesale ironmongers and builders' merchants, London—gross, £101,182.

The death occurred recently at Ashburton, Devon, in his 88th year, of Mr. John Hannibal Foaden, for many years a builder and contractor in the district.

THE SCOTTISH BUILDER

A GREAT ABERDEEN ARCHITECT

THE spring *Quarterly* of the Incorporation of Architects contains, in its opening paper, by Mr. T. H. Huges, A.R.I.B.A., in a series which will deal with great Scottish Architects of the Past, an account of the life of James Gibbs.

Gibbs was born at Footdee, in 1682, according to a manuscript document, was the son of a merchant, and studied at the Grammar School and Marischal College, where he graduated M.A. It was not merely a taste for drawing, but also a sound knowledge of mathematics, and perhaps inspired by report of Wren's fame, that made him turn to architecture. He studied first in Holland, and later, under the patronage of the Earl of Mar, in Italy, under Carlo Fontana and the painter Garoli. On his return in 1709, he settled in London, where he had the patronage of the Earl of Mar and the Duke of Argyll, and the friendship of Wren. He was made one of the surveyors to the Commission for the Building of Fifty Churches, and this brought him, in 1714, his first commission—the Church of St. Mary-le-Strand. His next important public work was the designing of St. Martin's-in-the-Fields, the steeple of which "has a beauty comparable to the best of Wren's." Various other London churches followed, and among the work which quickly began to flow in upon him were commissions for many noblemen's houses, notably "Ditchley," in Oxfordshire; and Sudbrook Park, Petersham; and several pavilions for the gardens of Viscount Cobham's famous house at Stow.

Gibbs was particularly successful in his designs for smaller houses where no unnecessary architectural features were indulged in, and many of them have a great charm. One such small house is Balveny House, Banff, which is illustrated in "Vitruvius Scoticus," and there attributed, by William Adam, to James Gibbs.

Gibbs prepared numerous designs for garden temples and summer houses, which were considered in the eighteenth century to be essential to the gardens of every large country house. For Viscount Cobham's famous gardens at Stow, Gibbs designed several pavilions, though he was not the architect for the house.

NEW BUILDINGS IN SCOTLAND.

Coatbridge.—HOUSES.—The T.C. has receiv approval from the Board of Health to er 224 houses at Whifflet, under the slum clearar scheme.

Port Glasgow.—HOUSES.—Colonel J. Arthur, architect, states that he has prepar plans for new houses to be erected in accordar with the Board of Health regulations as appl to Port Glasgow, in connection with the cent improvement scheme, to replace the hous proposed to be demolished. The estimated co as reported by the town treasurer, for t demolition of the existing houses and the erecti of new houses, is £75,000.

Dundee.—HOUSES.—The Corporation Hous Committee has a proposal under considerat for the erection of 200 concrete block house

Renfrew.—OFFICES.—The Dean of Gu Court has passed plans for new offices a Council Chambers for the Parish Council.

Edinburgh.—CINEMA.—The Dean of Gu Court has passed the following plans: T Lyceum Cinema, Ltd., for the erection of new picture house at the corner of Slatefo road and Robertson-avenue; seven self-c tained houses at Colinton-road; a house Barnton-avenue, Davidson Mains; a villa Alnwick-road; and a house of Jeffrey-aven Shieldhall.

Ailsa Craig.—SCHOOL.—The Ayrshire E will consider the question of providing a sch and teacher's residence on the island of Ai Craig, in the near future.

Oban.—OFFICES.—The Argyllshire E.C. pointed a committee to consider the quest of providing new council offices.

Greenock.—EXTENSION.—A proposal is foot to extend the Greenock Eye Infirmary a efforts are being made to raise £12,000 the purpose.

Aberdeen.—HOUSES.—The T.C. has pas the following plans: Two houses, Deemou road, for the Northern Garden Suburbs, Lt bungalow, Westburn-drive extension, for Mess Williamson & Bell, architects; and bungalo Westburn-drive extension, for Mr. Forbes Rae, granite merchant.

Galashiels.—PREMISES.—The Trustees of t Galashiels Savings Bank have settled on bui ing new premises in Bridge-place, at a cost £4,000. Messrs. J. & J. Hall, architects, Ga shiels.

Glasgow.—VARIOUS.—The Dean of Gu Court has passed the following plans: Ten pavilion at Belvedere Hospital and day nurse and clinic at Sister-street and George-stre Mile End; Glasgow Corporation Electric Department, sub-station at Norham-stree David Mason, Dalziel-drive, Pollokshields, vi in Dumbreck Priory, off Dumbreck-road; t Glasgow E.C., reconstruction of latrines various schools; J. A. Taggart & Co., Ltd., Bath-street, 12 shops in Crossloan-road, W Corporation of Glasgow (Blind Persons Act), n roof at Blind Asylum, Castle-street; and Jo H. Nicol, St. Vincent-street, an hotel a restaurant, at Wigton-street, Port Dundas.

Widening of Princes-street.

Among other matters which came before t Court of Common Council at Guildhall recent were the proposed widening of Princes-street a an invitation from the London County Coun that the City Corporation should join in inquiry into the existing and future provisi of means of road transit across the Thames London.

The Improvements and Finance Committe recommended that the notices to treat to acqui the ground needed for the widening of Princ street to 60-ft. throughout should be forthw served and that a resolution of May 31, 19 agreeing to such widening, subject to the Lond County Council contributing one-half the n cost, should be varied in accordance.

BUILDING TRADE WAGES IN SCOTLAND.*

211,350.—N. Simpson: Flushing cisterns.
211,358.—E. Philpots: Gully traps.

* All these applications are now in the stage in which opposition to the grant of Patents upon them may be made.

TRADE NEWS

Bennett's patent bed grip and end-tongued system wood block flooring is being laid by the Zeta Wood Flooring (1910) Co., Ltd., in the new Westminster Bank, Threadneedle-street, and at the Wolseley Motor Works, Chelsea.

Mr. Ernest G. Blake, 8, Beaumont-road, Windsor, is preparing a survey dealing with building matters. He will be glad if those firms who manufacture roof coverings of any description will send particulars of their products to him for inclusion in the text.

Messrs. Bryce, White & Co., Ltd., inform us that their new Southampton branch is now well stocked with doors, mouldings, &c., for immediate delivery. This information will, no doubt, be of assistance to our readers in the South of England who are in immediate need of doors, &c.

Mr. Frederick Parker, of Viaduct Works, Catherine-street Extension, Leicester, has published some very complete catalogues on road-making machinery, dealing with concrete mixing, stone drying, stone breaking, granulating, crushing, elevating, conveying and screening. Copies will be sent post free on application.

The Allied Arts and Crafts Guild, of 4, Brook-street, Birmingham, has been entrusted with the re-construction and decoration of Messrs. Owen Owen's premises at London-road, Liverpool. The ground floor is to be re-constructed on "Doric" lines, the first floor "Ionic," and a special feature will be made of the restaurant on the second floor, the main restaurant is in the "Renaissance," and the smoking room in the "Jacobean" period.

Messrs. Wood Russell & Co. send us several detailed leaflets dealing with "Sentry" boilers. They mention in particular their latest product, the "Sentry Minor" No. 0. It is designed to operate with a hot water storage of 25 or 30 gallons, and has a maximum output of three 20 gallon hot baths at 100 deg. Fahr. per hour, the normal fuel consumption on continuous day and night working being approximately one ton of small broken coke for four months' work, say, 4d. per 24 hours for a perpetual supply of hot water for bath, sink, lavatory basins, &c. A towel rail or a small radiator can be heated also if required.

On Tuesday, May 27, a party of advanced students from the Architectural Association paid a visit of inspection to the Homerton paint, colour and varnish factories of Messrs. Lewis Berger & Sons, Ltd. After being received by the management they were conducted on a tour of the most interesting features which the modern plant of this 164 years old firm could show. They saw fine dry colours in the making, varnish running and maturing, and paints and enamels being made by machinery. At the conclusion of the tour the party witnessed the application by practical painters of the products whose manufacture they had just watched, and were interested in the results produced with "Matone" flat oil paint, "Exilac" white enamel, "Matroil" japan-bound washable water paint, and "Pompeian" two-coat high-gloss paint.

TO PUBLIC HOUSING AUTHORITIES, ARCHITECTS, BUILDERS, WATER ENGINEERS and others interested. An important Treatise on the use of Copper and Brass in Domestic Water Services has been published by the Copper and Brass Extended Uses Council, and copies may be had from the Secretary, Graham Squiers, F.C.A., King's Court, Colmore Row, Birmingham.

TENDERS

Communications for insertion under this heading should be addressed to "The Editor," and must reach him not later than Tuesday evening.
*** Denotes *accepted*. † Denotes *provisionally accepted*.**
‡ Denotes *recommended for acceptance*.
§ Denotes *accepted subject to modifications*.

ABINGDON.—For construction of a road and laying down sewers in connection with the housing scheme extension at Boxhill, for the Borough. Mr. E. V. Hall Engineer, Municipal Offices, Abbey House:—
†J. Wheeler, Abingdon £2,776 15 2

BASINGSTOKE.—For treatment of roofs of housing estate, for T.C.:—
‡Messrs. John William & Co. £576 10

BIRKENHEAD.—For erection of the War Memorial on a site fronting the Town Hall, for the Corporation estimated to cost £5,000, to design prepared by Prof. L. B. Budden, of the Liverpool University:—
*Joseph Davies, Hamilton-lane.

BOSTON.—For erection of two pairs of cottages at Amber Hill, for R.D.C.:—
*E. W. Dawson, Boston .... £810 per pair.

BOSTON.—For supply of gravel and shingle, and of concrete kerbs, for the R.D.C.:—
*Pindar & Sons.
*The Yorkshire Henebique Contracting Co., Ltd.

BOURNEMOUTH.—For making-up six roads, for the T.C.:—
*M. Loader £2,218 2 1

BOURNEMOUTH.—For extensions, &c., at Police Station, for the T.C.:—
*Turl & Sons £7,025 17 9

BURNLEY.—For supply and fixing of railings in connection with Church-street improvement, for the T.C.:—
*T. Ashworth & Co. £355

BURNLEY.—For providing additional office accommodation at Town Hall, for the T.C.:—
*B. Smith & Sons—*Masons' work*.... £244 15

‡Walter Dyer, Ltd. ..... £495 each

DEVIZES.—For erection of eight houses, for the R.D.C. Mr. T. V. Trumper, Surveyor:—
For two pairs of cottages at Stanton St. Bernard—
L. Maslen & Sons, Devizes £1,800
†W. Huntley & Son, Marlborough.... 1,586
For two pairs cottages at West Lavington—
L. Maslen & Sons, Devizes 1,910
W. Hopkins & Sons, Devizes 1,783
G. J. Holloway, Devizes 1,725
†T. Slade, Devizes 1,700

DINGLE.—For construction of sewerage and water supply system, for the T.C. Mr. P. H. McCarthy engineer, 26, Lower Leeson-street, Dublin:—
P. Dillon, Limerick £24,967
Fleming Bros., Dublin 19,067
W. Nally & Co., Dublin 17,512
*T. J. Moran & Co., Cork 17,399
Engineer's estimate 17,492

DONCASTER.—For the widening and improvement of Hall Flat-lane, Springwell-lane, and Ashfield-road for the T.C.:—
*Edcaster, Ltd. £4,334 13 7

DUMBARTON.—For alterations and restoration of Glencairn House, High-street, for the Gas Committee. Mr. Wm. A. Macartney, Burgh Engineer, Municipal Buildings. Quantities by Messrs. Colin Young & Smith, of Glasgow:—
Joiner—
*George Prentice, Clydebank.. £1,635 1 6
Mason—
*George Prentice, Clydebank.. 1,754 0 3
Plumber—
*David Sinclair, Dumbarton.. 202 9 7
Plasterer—
*Robt. Devlin, Dumbarton .. 158 2 8
Slater—
*Robt. Devlin, Dumbarton .. 223 3 7

DUNFERMLINE.—For duplication of Glensherup water main, for the T.C. Messrs. Crouch & Hogg engineers, 17, Lynedoch-street, Glasgow:—
J. Ritchie, Dunfermline..... £13,742 8 4

ELLAND.—For the widening of Hullen Edge-road above the Elland War Memorial, for the U.D.C.:—
*D. Rawson, Elland.

ELLESMERE PORT AND WHITBY.—For making up Picton-avenue, for the U.D.C.:—
*J. W. Flather £335 5 1

ESSEX.—For (*a*) resurfacing 32,000 sq. yds. Writtle-road, and (*b*) 17,000 yds. of Epping New-road for the C.C.:—
Per yd.
*(*a*) Associated Asphalte Co. ..... 8s. 9d.
*(*b*) Neuchatel Asphalte Co. ..... 8s. 9d.
(With free maintenance for five years.)

FRATING.—For widening bridge, for the Essex C.C. :—
*A. J. Arnold £1,025 4

GAINSBOROUGH.—For erection of 16 houses in Burns-street, for the U.D.C. :—
*A. J. Elins, Gainsborough.

GLASGOW.—For construction of additional lavatory accommodation at City Hall, for the T.C. :—
*G. Munro £280 4 10

GLASGOW.—For alterations to Kelvinside sub-station, for the T.C. :—
Brickwork—
*W. Taylor & Son £4,668 10 3

HAROLD COURT.—Erection of sanitary annexe at Sanatorium, for the Essex C.C. :—
*A. Holmes, Chelmsford £120

THE BUILDER

A JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

VOL. CXXVII.—No. 4250. JULY 18, 1924.

THE OLD AND THE NEW

THE Oxford Conference of the Royal Institute of British Architects is over, and we are thinking of the future and next year's meeting. The exceptional success of the meeting was due in a measure to the brilliant weather, a good attendance of members from all parts of the country (though there were not as many present as should have been) the varied and interesting programme which was arranged by the Berks, Bucks, and Oxon Architectural Association, in conjunction with the Institute, and the hospitality given to the Conference everywhere. But these were only contributory, though important causes, for that which will make the Oxford Conference long remembered by those who were fortunate enough to take part in it, and especially those who had not visited this unique city before, if there be such, was Oxford itself. There are some things which cannot be described; or they may be described and the elusive something which is inherent in them, but which is seen only as a personal revelation, will remain unsaid. Oxford is not one city; there is at least a duality about it, and whatever the townsman may think and however just his legitimate pride in the growth and prosperity of the commercial life of his city, the colleges and the intellectual life which moves in and around them stand apart. The commercial life flows in and out as it does in other cities, but the colleges stand as they have for centuries as separate communities with a communal life of their own, and as they will possibly continue for centuries to come. What that life is some fortunate members of the Conference were able in some slight way to realise during their stay in the rooms of some of the colleges; but it was felt by the Conference as a whole during the visits to the beautiful chapels and halls, quadrangles and gardens, which give such a distinctive and impressive charm to so many of the colleges. Who could have failed to be impressed by the spirit of the ages, the mediæval atmosphere which pervades these establishments, or by the consciousness that many of our country's greatest sons, who have lived to make our country's history, have lived and worked in these buildings? There can surely be no need to debate the respective claims of Oxford or Cambridge to a greatness greater than their own, or to consider which is the most perfect of so many perfect establishments. Those who saw Wadham College and grounds in the night of the reception there knew, as they sauntered in the beautiful gardens in the half light and noticed the soft and impressive appearance of the chapel and cloister and the subtle light from the hall, that nothing more enchanting would meet their eyes, though the reception in the hall and gardens of Magdalen College had not then taken place, nor the visits to Christ Church, New, Merton, All Souls, and many other buildings; and the beautiful gardens of Worcester College, the many chapels, halls and libraries, containing in their magnificent architectural shells so many treasures of the past, the paved courts, façades, spires and towers, green lawns and meadows—who could adequately describe all this, which makes of Oxford the glorious city it is? or the continuity of English life and customs which are held within its college walls? This heritage of the past, of which the city is so proud? Of the noble buildings, which are a triumph of English architecture?

The pride of Oxford in her city we can all understand, for in it we share; but we shall not do justice to such a wonderful city if our admiration springs from nothing more than an intellectual appreciation of the arts which are embodied in, or the setting of, these buildings? What was it that inspired the mediæval builders and craftsmen and gave them the ideas with which to carry out their work? We do not know, unless we believe they worked with a spiritual inspiration which made their buildings what they are. We know that with them building was made to perform its function and was based upon an ascertained law, but we must believe that above this there was a spiritual quality about their work, and which was part of a religious age, when men designed in beauty and built in truth and when every craftsman took pleasure in his work and tried to impress it with sincerity and meaning.

But we must not conclude that in this more materialistic age these spiritual influences and this sincerity in work are altogether absent in our own achievements. Great works are still being erected to the glory of God and as a manifestation of man's spiritual beliefs; and if there seems to be much in our daily life and work which appears to be antagonistic to the spiritual side of our nature, we know that, fortunately, some of the noblest works of man are still being erected in this spirit and with this aspiration. We saw in such a city as Oxford the great works of a past age, when a city devoted itself to the care of the mind and the soul, and side by side with the erection of scholastic and religious buildings it could yet carry on an active commercial existence; but we may take heart that in a progressive modern city in which commerce takes a leading part, a great building is being consecrated this week, which owes much, if not all, to man's spiritual aspirations, and which is at the same time as inspiring and beautiful, though not so mellowed with age and sublimated by history as the works of the past. In this building we see that man has still the skill to produce great art when called upon to do so, and what the genius of our race has accomplished again and again in our history we see realised in this noble building. Liverpool Cathedral is without doubt one of the greatest works of the century, and whether it will be the greatest time alone will show; and while we can congratulate all those craftsmen and others who have been associated in the erection of the building, it is for the architect we feel a special admiration, coupled with the hope that he may live to see the completion of his great work. Great as the building is as an architectural achievement, the history of its inception and design will always be something of a romance in the popular mind, and to the architectural student a stimulus and encouragement. Just as the beautiful old buildings at Oxford add to the pleasure of our time and afford us an invaluable link with the past, so may this great essay in church building at Liverpool carry on a message to far distant years of the beliefs and artistic capacities of the present day.

NOTES

Liverpool Cathedral.

An event such as the consecration of Liverpool Cathedral will of necessity be regarded with a large variety of thought. To many it may be a matter of comparative indifference amongst the varied and divergent claims of modern life, but to the profession and the building trade, whose interests we do our best to represent, the opening of this great cathedral church must be of a far-reaching significance. To some of us it may not seem strange that, notwithstanding the clever writing which has aimed to prove that Gothic art was dead and could never live again, in any real way, we yet see reared in our midst a great English Gothic church which, as we stand under its lofty vaults, yields nothing in impressiveness and architectural charm to few buildings in the whole world. We do not believe that the instinctive love of Gothic art in this country is yet dead, and we have never felt sure that the genius of Bentley was devoted to its highest and best in the Westminster Cathedral, fine as it is. Bently's Gothic was a living art, and we have often wished that its expression in such a building as the Church of the Holy Rood at Watford had found such a great possibility as was afforded at Westminster. We may well hesitate to pronounce a judgment in the name of posterity, but so far as we can judge for ourselves we can congratulate our countrymen in possessing such a fine example of design and craftsmanship in stone, wood and metal as the new Liverpool Cathedral. To its creator, George Gilbert Scott, we are quite sure the work has brought its own great reward, and we must now hope that in due course he may see the whole scheme of design complete.

Appreciation.

We have devoted a good deal of space to reflect as far as possible in one issue the outstanding values of Liverpool Cathedral. Such a great building cannot, of course, be fairly dealt with in a single issue of any paper, and more especially we feel that the beautiful craftsmanship in metal and wood and stone can only be fully realised by an inspection of the building itself. In addition to the appreciation by Professor Richardson in this issue, our readers will note with interest that by Mr. E. Bertram Kirby, O.B.E., F.R.I.B.A., in the current issue of the Institute *Journal*, accompanied by some good illustrations, and we may here note that this number is a further happy instance of the increased value which we have found during some time past in the *Journal* of the Institute.

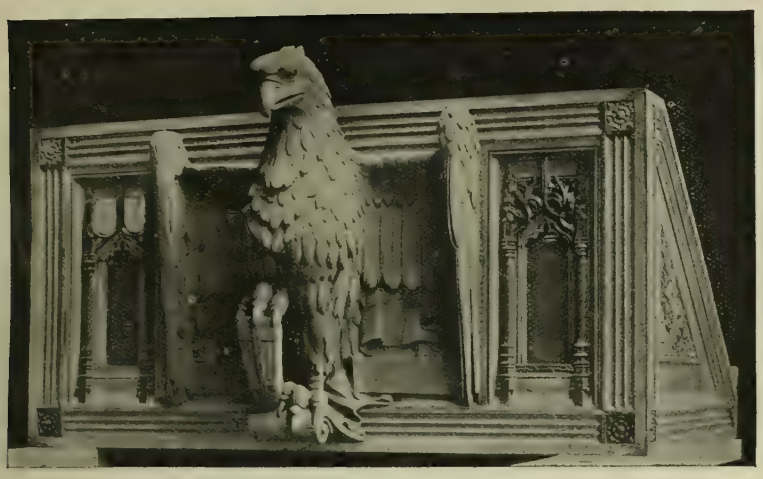
Liverpool Cathedral: View of East End.
Mr. G. Gilbert Scott, R.A., Architect.

Thames Bridges.



We are glad to learn that the London County Council has appointed a special committee to formulate a policy on the subject of bridges, and especially that three of the twelve members of the committee are Major Harry Barnes, Mr. Andrew T. Taylor, and Sir Howell Williams. That the question needs to be considered as a whole, most well-informed people are agreed, and it is a hopeful sign that such a committee has been appointed and that the question of Waterloo Bridge is to be referred to them.

Waterloo Bridge.

In this connection, we note with pleasure the letter by Professor W. R. Lethaby, which appeared in the *Times* of Wednesday. Professor Lethaby writes: "It has been discussed whether the 'Æsthetic appearance' of Waterloo Bridge would be injured by widening or other alterations. The argument may confuse us into forgetting that the bridge is a great London monument just as it is. Putting aside the Abbey, the Tower, and the Guildhall as survivals from the middle ages, Waterloo Bridge is the most representative monument after St. Paul's Cathedral. These two buildings more than any others symbolize the Metropolitan City of the Empire, and should be regarded as sacred works of art to be maintained as they were built."

Housing: A Suggested Royal Commission.

Sir Arthur Griffith-Boscawen contributes an interesting article to the *Times* of Wednesday on the housing question, and we heartily endorse his opinion that we need more light on the subject before we commit ourselves to the Government's scheme. He says: "One hesitates to suggest a Royal Commission, which is the usual device employed by embarrassed governments to shunt awkward questions. But I feel sure that we require further light on such questions as these: (1) How can private enterprise, as we knew it before the war, be brought back into the business? (2) could the plan adopted in some American cities of freeing new houses from rates for a term of years be applied with good results here? (3) have we thoroughly explored labour-saving devices and new methods

Liverpool Cathedral: Lectern. Mr. G. Gilbert Scott, R.A., Architect.

of construction and new materials? (4) can we not make greater use of public utility societies and amend the Small Dwellings Acquisition Act, so as to make it really operative? and (5) how are foreign countries, who are faced with the same problem, endeavouring to solve it? We want, not temporary makeshifts which may tend to make the ultimate solution more difficult, but the establishment of a permanent policy."

The Thames Conservancy. Those fortunate enough to accompany the river trip from Oxford to Dorchester in connection with the architectural conference at Oxford, must have been struck by the excellence of the new cottages for the lock-keepers, and must have felt grateful to the Thames Conservancy for the pleasure of seeing such good work. The River Thames is a national heritage and its beauty (and, we must add, sometimes its ugliness), is dependent as much upon the surrounding architecture as upon the natural beauty of the landscape. The enforced halts every two or three miles at the locks where the gardens and cottages are well laid out and designed add to the pleasures of the journey. The Conservancy is to be congratulated upon its own cottages, and it is a pity that it has not a controlling voice in all the new houses that line the banks of the River.

International Congress on Architectural Education. An important exhibit at this Congress will be the work of schools of architecture. About 50 schools in Great Britain, the British Dominions and foreign countries will participate, and in view of the large number of exhibits it has been found necessary to obtain the use of Devonshire House and Grosvenor House in addition to the galleries of the R.I.B.A. The exhibition will be a remarkable example of the work done in schools of architecture all over the world and should prove of very great interest to all architects. In Devonshire House, Piccadilly, there will be exhibits from the schools in Great Britain and the British Dominions, together with a selection of drawings prepared by R.I.B.A. prize-winners; while in Grosvenor House the work of schools abroad will be shown. The R.I.B.A. galleries will contain a selection of work done at the British and French schools and the American Academy at Rome, and there will also be an exhibition of educational books and equipment. The exhibition will be open from July 28 to August 2, inclusive, from 11 a.m. to 9 p.m. daily.

The Building Trade Dispute. We report on p. 105 the developments which have taken place in the building trade dispute since our last issue. Lord Buckmaster's report, embodying the recommendations of the Court of Inquiry over which he presided, will probably be issued this week, and it is thought that the Minister of Labour will endeavour to use the Report as a basis for peace negotiations. We are glad the employers have denied the statements attributed to Mr. G. Hicks, on behalf of the operatives, that "the employers have plundered the public to the extent of £300,000 by adding to their contracts on and from May 1 the equivalent of ½d. an hour increase in wages, which has not been paid to the workers." It would not be an easy matter for the employer to do any such thing, even had they desired to do so.

The Sheldonian, Oxford.

From a Sketch by Lt.-Col. H. P. Cart de Lafontaine, A.R.I.B.A.

GENERAL NEWS

Centenary of University College.

The hundredth anniversary of the foundation of University College, London, will be celebrated in 1926. Materials (records, reminiscences, pictures, photographs, &c.) are being collected with a view to the production of a history of the college as a part of the centenary celebrations. The volume will include a chapter on the school of architecture. Members and friends of the college are invited to send such materials as they can contribute, which will, in due course, be returned.

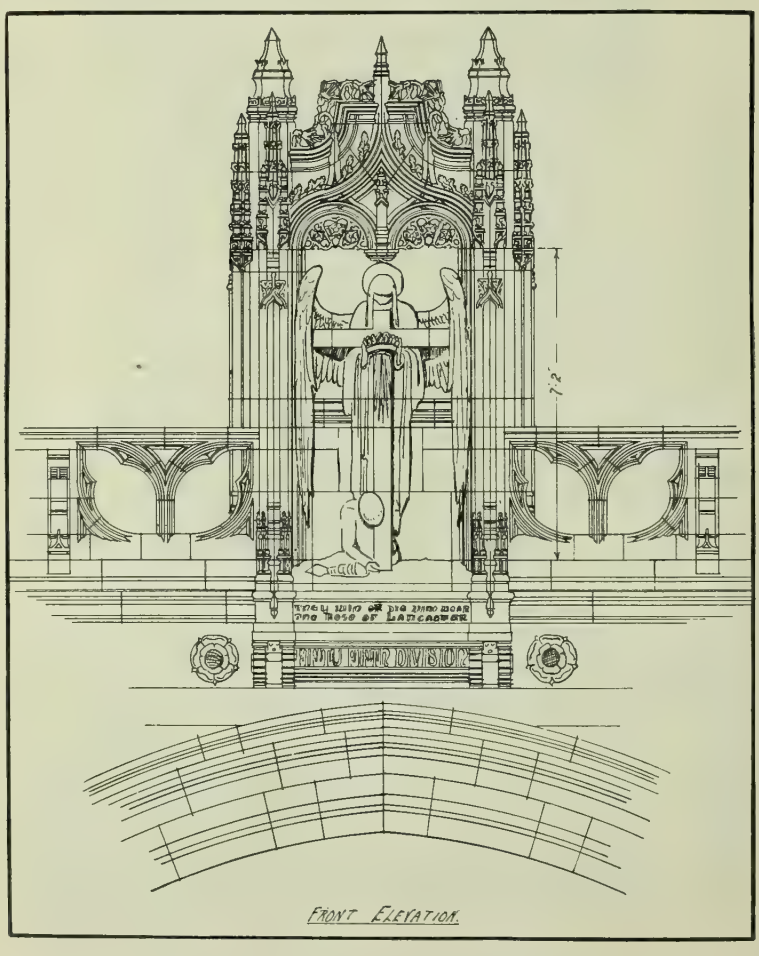
New Wharf on the Thames.

Messrs. Harrisons (London), Ltd., have decided to reconstruct their existing timber wharf at Purfleet, in reinforced concrete. The new wharf, it is stated, will be one of the most important on the River Thames, being about 1,000 ft. long, with a depth of water of about 40 ft.; while the distance from the coping to firm bottom is about 60 ft. Mr. R. W. Strozer, M.I. Mech.E., specialist in reinforced concrete, is the engineer for the scheme.

The late E. Swinfen Harris.

The death of Edward Swinfen Harris, F.R.I.B.A., took place recently at his residence, Stony Stratford, Bucks.

Mr. Harris was born in 1841 at Stony Stratford, and was the son of a local solicitor.



At the commencement of his career he shared London offices with the late Mr. Clement Dowling and Mr. F. Richard Farrow, F.R.I.B.A.

His work consisted chiefly of churches and domestic work in Buckingham, Oxford, Bedford, and Dorset. Among his works were a mansion and vicarage at Maids Moreton, houses in Buckingham and Stony Stratford, additions to Tickford Abbey, and two houses at Newport Pagnell. Mr. Harris will be remembered as a frequent correspondent in our colums.

COMPETITION NEWS

Cambrai and Soissons.

Designs for a memorial to the Missing. Application should be made to the Secretary (Works), Imperial War Graves Commission, 82, Baker-street, W.1.

Public Baths, Newton-in-Makerfield.

The Council has appointed Mr. Arnold Thornely, F.R.I.B.A., assessor in this competition. Applications not later than July 25. Sending-in day, September 30. Conditions can be seen at this office.

Aldershot War Memorial.

The conditions of this competition are not in accordance with the Regulations of the R.I.B.A., and Members are advised to take no part in it.

Masonic Memorial.

Designs for rebuilding Freemasons' Hall, Great Queen-street, Kingsway. The competition to be conducted in two stages. Each of the architects submitting a design in the final competition will receive an honorarium of £500. Assessors, Sir Edwin Lutyens, Mr. Walter Cave, Mr. A. Burnett Brown. On receipt of one guinea competitors will receive conditions of the competition, which has the approval of the R.I.B.A., together with block plan of site.

Applications marked "M. M. M. Competition" must be received by The Grand Secretary, Freemasons' Hall, Great Queen-street, London, not later than August 23.

Other Competitions.

Other competitions still open include the following (the dates given are, first the sending-in date, and second the issue of *The Builder* in which full particulars were given):—Ross-Smith Memorial (Sept. 30; Feb. 21). Harrogate Infirmary (Sept. 30; May 30). Hamilton War Memorial (Sept. 1; May 30). Glasgow High School Memorial (Sept. 30; June 13). Masonic Memorial (Aug. 22; June 13). Bexhill Entertainment Hall (Sept. 1; May 30).

LIVERPOOL CATHEDRAL

By A. E. RICHARDSON.

No evidence more striking of the modernist tendency is conceivable than that shown in the intellectual achievement of Giles Gilbert Scott at Liverpool. It seems scarcely possible that one man could have had the direction of such an assemblage of material in the short span of twenty years, and could have embodied the fresh daring of youth and the flowering of manhood into a fragment of a stupendous building which, like Wren, he may yet live to complete. The term fragment is not employed in a derogatory sense, for the completed portion has a vastness in itself that is awe-inspiring. To eyes accustomed to antiquity and slow growth it may appear strange that a city like Liverpool should be fit to receive a cathedral which will inevitably take its place with the masterpieces of the world. Yet the miracle has begun and is continuing; nay, it is not too much to say, has been aided by advantages of site and setting; for not only will the city be able to boast of its fane but will be proud of the homely dignity of the precincts which came into existence, for a different purpose, over a century since. The English have a peculiar way of arriving at success through a series of mistakes. It is a national trait; they are the first to acknowledge their blunders, nothing daunted to set about mending them; hence the extraordinary vitality attending national works. Here, in the midst of Liverpool's teeming activities, where commerce may be said to rule, has been waging a conflict of architectural opinion for a hundred years. There have been minor skirmishes between Gothicists and Classicists with a decisive victory for the latter when Cockerell finished St. George's Hall for the invalid Elwes. There have been reverberations of the Classic theme, not always on the ascending scale, and now at last has arisen the first portion of a building of metropolitan import which, partly freed from the conventions of style, expresses as no other building in this country does the true articulation of the art. How, then, has this miracle been accomplished? Not by the precepts of academies; not by the dogma of schools. On the contrary, it presents the sum total of Victorian effort in the direction of insular tracts and concentration. It has resulted from traditions handed on from father to son and grandson; but it needed the physical strength and mental daring of youth to give it life; it called for ecclesiastical support that dared to maintain belief against a materialism that unchecked presaged decay for the moral fibres of a people.

I came to Liverpool to gather impressions of the work as a pilgrim, not as an architect or a critic seeking for explanations of plan or secrets of structure, or as one prepared to find some minor detail which did not accord with academic ritual. My way was along Watling-street, not exactly a cathedral route, although St. Albans, Lichfield, and Chester stand athwart the road. In the late afternoon from the Cheshire shore the silhouette of Liverpool did not offer the dominant building one had been expecting. It was with difficulty that the completed choir could be picked out above the delicate verticals along the water's edge and the masses of drab walls and horizontals that follow the contours for miles. There was less trouble in noticing the bizarre towers of commerce and a thrill when the gay colouring and refined upper works of a liner threw the background into greyer obscurity. Then, without warning, the choir of the new cathedral took its place above the wrack of smoke, a simple mass with twin points at the extremity, and the long lines of the Lady Chapel anchoring it down to the roofy steppings. Such will be the impression the building will make on those who arrive in the Mersey from abroad.

A totally different impression is gained when the building is approached from the heart of the city. Here one sees it as some mighty fragment of a work projected ages since which will take centuries to complete. The old cemetery, partly formed in a disused quarry with its natural trees, exotic tombstones, monuments, and meandering walks, as well as the interminable length plain iron railing, completes the illusion. The building takes on the character as well as the repose of a structure that has been in possession of the site from time immemorial; one, moreover, that makes the eighteenth-century houses appear as recent intruders and only there on sufferance. It is not a little curious this turning of the tables, this founding of a ready-made but not the less entrancing cathedral close. The choice of site was a stroke of genius: one of wise selection and congruity. Below is the Mersey, an arm of the sea, with its choir invisible of sea chanters with deep Gregorian voices, and beyond rise the close-packed streets of Birkenhead and the tiny windmill on Bidston Hill. At closer quarters the distant impression of the mass gives place to feelings of admiration and respect; one is almost terrified by the scale; individuals seem tiny. One experiences the same sensation as one does in Rome, such is the telling artistry of the design: the seeming nonchalance with which the great masses have been arranged to fit the natural shaping of the site: the ingenuity shown in dealing with the levels, and the pure abandon and delight of the composition and adjustment of the parts. It is an achievement that is primarily intellectual, but it has its foil on the emotional side not effected by an overlay of intricate detail but by an interpenetration of structural parts which have an intrinsic decorative value. There is no evidence of false scale or of design and intent. The external aspect of the Lady Chapel, small by comparison with the gigantic choir and situated many feet below, is at one with the main fabric to which it is attached by bold buttresses that terminate in the sub-motif of a gabled arcade with porch below, the latter a species of rotula which holds the separate buildings in unison. Beyond this is the mass of the south transept rising sheer in its strength with plain surfaces and construction revealed.

From the north the conventional scenery is eloquent; no mere description can convey an idea of the innate mastery of form combined with direct statement that makes up the termination of this work which, even if it were never completed, would still be a masterpiece of building. It is from this side that the lines of the Lady Chapel are the most forceful and serve at their best to ensure repose to the huge masses of the choir, and it is from this end that the spectator gains the most vivid impression of the purpose of the plan and the manner in which the walls have been made to speak in a vertical direction. The fact that a free interpretation of English Gothic has been taken for minor details enhances the character, the very modern aspect of the building, and aids the freedom and fancy of its form. As one changes one's viewpoint, so the perfection of scale and the maintenance of the dominant theme is borne in the mind. There is present that ever-changing diversity never absent in the old work, from which one never tires but always returns expectant; that element of wonder without which a work of art is never complete. The compelling note is scale, but there are rare delicacies of galleries and arcades to point the moral, there are signs of articulate construction to cheer and uplift. As one views the building it seems to grow and develop a thousand new points of interest and to reduce one to a very low opinion of one's stature morally and intellectually. The building, strange as it may appear, does not look new, yet it is modernity itself; already the stone is weathering, the accents are softening, the tracery and the cusping taking on that indefinable delicacy allowed by the passing of years.

So much for the external aspect. My pen is incapable of dealing with the design at greater length. It refuses to run to technical descriptions which the architect alone knows. Late in the evening a considerate verger opened a door that led into the choir, where a group of clerics were rehearsing for the ceremony of the building's consecration, and the promise of the exterior was more than fulfilled from the glories of the perspective that met my eyes. Here was all the soaring ambition of pier and vault rising higher than the vaulting of Westminster. A perfection of masonry holding the shadows and as yet unattuned to music and the human voice. A vastness that seemed impossible, an intricacy of detail where no detail seemed permissible, a play of geometrical form that appealed to the instincts of the heart and the imagination, at once reducing the mind to insignificance and causing one again to marvel that one man should have achieved so much. It is a work of structure, not of decoration; a building that shows a consummate regard for anatomy and ultimate artistry; a work emancipated from tricks and deliberate effort, free and soaring; inheriting all that the past can offer in quality and yet expressing the fact that the soul of man in spite of mundane affairs still seeks for the unattainable.

It would be an anti-climax to give a detailed account of the Lady Chapel other than to say that it is a cathedral in miniature, or to dwell on the construction of the Chapter House, the gift of Liverpool Freemasons. The architect has dealt with the question of modern tracery with refreshing zest; he has achieved new geometry in the design of the vaulting and semi-domes. His fancy has led his pencil into a variety of forms in the design of minor features which may not please the archæologist or the pedant but which in themselves will last to sustain endeavour of a similar nature. Then must be remembered the masons, sculptors, craftsmen, the clerk of works, and foremen, who have supported the chief builder; who in turn have aimed at perfection and have obeyed without question the directing genius of the author. Before me lies the road to London. I shall pass many fair churches, but the memory of the new cathedral will not fade. It is stupendous, compelling—the most notable achievement of the age!

CORRESPONDENCE

[While we are glad to publish letters on professional and other matters of interest to our readers, it must be understood that we do not necessarily endorse the remarks of correspondents, who will oblige us if they will express their views as briefly as possible.]

"Coleshill," Berks.

SIR,—In reference to the unusual choice of aspect for this house, viz., east and west for the main fronts, it is interesting to find the architect, whether Inigo Jones or Roger Pratt, after making such a complete break with Jacobean tradition in plan and design, adopting the aspects recommended by Dr. Andrew Boorde, in his "Compendyous Regyment, or a Dyetary of Helth," published in 1542. There he recommends east and west for the chief prospects, especially north-east, south-east, and south-west; never south, for the south wind "doth corrupte and doth make evyll vapoures."

As to the architects of "Coleshill," since my return from the Conference, I have referred to Gotch ("The English Home"), who, on page 56 says the architect must have been either Jones or Webb. In the appendix, page 396, he says that "there is no doubt that Roger Pratt had something to do with 'Coleshill.'"

Personally, I should like it to be settled beyond doubt that Inigo Jones was the architect. I fear that now I shall never get a job like "Coleshill" to carry out, so I may never know whether I could really do anything nearly so good. There need be no disgrace in that, if it took a genius like Jones to do it; but there *would* be if a comparative amateur like Pratt had done it. Either there would be something lacking in myself, or in our modern methods of training.

So this controversy, Jones or Pratt, has also a bearing on architectural education and our present-day methods of carrying out building works, and opens interesting avenues of conjecture for our exploration.

V. G. S.

Top- and Side-lighted Picture Galleries.

SIR,—The claim made by a correspondent in a recent issue of the *Builder* that the number of top-lighted galleries on a given area can be doubled by making the ground floor rooms now lighted by windows, also top-lighted, is too absurd for serious consideration.

The point can be easily tested; the present Manchester Art Gallery, designed by Sir Charles Barry, is an oblong 170 ft. in length by 80 ft. in width. There is an entrance staircase hall about 50 ft. square. The whole of the remaining first floor area consists of top-lighted picture galleries. On the ground floor there are side-lighted rooms, precisely corresponding in size with those on the first floor, absolutely useless for the display of pictures.

The claim made in *The Builder* is that by making use of some New Zealand idea, the number of top-lighted galleries on this site can be doubled. I suggest they cannot be increased by a square inch. It would be wasting valuable space in *The Builder* to enlarge on the point. The side-lighted ground floor rooms will continue to be useless for the display of pictures, notwithstanding what it is alleged has been effected elsewhere. What applies to the existing Manchester Art Gallery applies equally to any new building.

T. SINGTON.

Barry or Pugin?

SIR,—Owing to the generous courtesy of the Royal Institute of British Architects in admitting the public to their exhibition of drawings of the Houses of Parliament, I was able to see and delight in examples of design in purely English Gothic. But to my amazement and disgust, I found them attributed to the classic Sir Charles Barry. If meant as a joke by gentlemen with their tongue in their cheeks, doubtless it is harmless enough. For it is hard to believe that the feeling for Gothic design has so completely departed that we can for one moment imagine that the classic Barry could design anything so thoroughly English and profoundly Gothic.

I am no archæologist, and care not a rap for the so-called evidences of authorship, such as Barry's own signature. For the evidence is in the thing itself, written all over in nearly every stone of the building. Any discerning and sympathetic soul can see our beloved Welby Pugin as the true and only possible creator.

For the sake of the young and for future generations I feel constrained to protest against this hoary falsehood.

C. F. A. VOYSEY.

Housing Scheme of the Government.

SIR,—Your leader of June 20 suggests that, in dealing with the housing question, "the short view in legislation would give the most beneficial results to the nation," because development, during the next one hundred years, or even changed social and economic conditions during the next fifteen years, may make our programme obsolete. But, except to advise that "we concern ourselves more with the things of the moment and less with posterity," you do not give any indication of what legislation should aim at in taking the short view, or what the short view means.

Long before the Armistice, I—then a temporary civil servant in the housing department of the Ministry of Munitions—advocated the legislative short view, and put a scheme before the Minister, under which I suggested the conversion of all the temporary housing schemes into cottages and workmen's dwellings; but I fear the time has passed in which the short legislative view was best; we must now take a long view, whether we like it or not.

For many years I have tried to insist upon the fact that housing and rating reform must go together; but I am but a voice crying in the wilderness, and few will listen. Rating reform will be a long process, but by extension of grants in aid of rates, rent might be relieved, say, two-fifths of the present all too heavy burden of rates. The scheme I have advocated, in addition to reform to lessen rate charge, provides for the State to supply the capital to public utility societies (and other approved concerns or persons), on the basis of borrowing on housing bonds, repayable capital and interest in forty years, and lending at a lower rate, repayable capital and interest in sixty years.

For every £100 raised, the State would lose 1½ per cent., equal to £1 16s. 4d. per annum (including interest) for forty years, and would receive, for the next twenty years after its own payments had ceased, £3 4s. 8d. for every £100. That is, by taking the long view (seventy-five years), the State loss would be a mere fraction of the enormous loss shown under the Government scheme. By lending at a loss of 1½ per cent., I estimate the State would lose £680,000,000 in the first forty-seven years, to gain £580,000,000 during the following twenty-eight years. The net loss in seventy-five years being £100,000,000 on the 2,625,000 houses proposed. Under Mr. Wheatley's scheme from 1924 to 1980 the State and local authorities lose over £1,300,000,000.

In addition to a saving of £1,200,000,000 during the next seventy-five years, my suggestion has the advantage of finding capital for building, which is lacking in the proposals of the Government, which, while giving a guarantee of a subsidy on rent, does nothing to create the house to be rented. Cheap capital is the best incentive to the housing enthusiast, who, without it, cannot take advantage of the subsidy. A further advantage is that the provision of cheap capital would enable the housing reformer to be independent of rings and combines, since he would manufacture and import what he required, unless the market prices of material were fair and reasonable.

A serious weakness in Mr. Wheatley's scheme seems to me to be the fact that it depends entirely upon the goodwill of the industry employed, which acknowledges that its interest in other activities is infinitely greater than in housing; whereas with plenty of cheap capital, housing enterprise would flourish without such dependence upon the big contracting firms who govern the building industry.

Housing cannot be divorced from politics. I offer a political programme to all parties by which housing, rating and poor law reforms are achieved, and unemployment reduced by at least 25 per cent., and at the same time more than £1,200,000,000 saved to the taxpayer and ratepayer. The Government propose to give to rentpayers £13 10s. per annum on 2,625,000 houses, at a cost of £1,376,000,000. I propose that the Government should lend capital to build 2,625,000 houses at a cost of £100,000,000 in seventy-five years by the creation of bonds and loans. As an illustration of the idea, the following figures will be enough to show the principle, without troubling you with figures of compound interest for seventy-five years. Instead of a subsidy on rents, I would make it possible to build houses to let at economic rents within the means of the wage earner, by the provision of cheap capital, lower rate charges, cheaper building material, and better output.

	£ s. d.
£400 Bonds created by State borrowing at 4 per cent., capital and interest repaid in 40 years at £5 1s. per cent.	20 4 0
£400 Loan to Public Utility Society at 2½ per cent., capital and interest repaid in 60 years at £3 4s. 8d. per cent.	12 18 8
Difference being State loss for 40 years £1 14s. 4d. per cent.	7 5 4
Loss in 40 years per house (average loan £400)	294 13 4
Less gain of £12 18s. 8d. for 20 years after State liability has ceased	258 13 4
During period of 60 years, nett loss per house	36 0 0

Equal to 12s. per annum loss instead of Mr. Wheatley's £13 10s. for 40 years.

COMPARATIVE FIGURES.

	Mr. Wheatley's Scheme. £ s. d.	My Scheme. £ s. d.
Cost per house per annum	13 10 0	12 0
Capital loss per house	540 0 0	36 0 0
Total loss on 2,625,000 Houses	£1,400,000,000	£100,000,000

COMPARATIVE RENTAL VALUES OF HOUSE TO COST £500.

GOVERNMENT SCHEME.

Weekly rental		11 10
£9 1s. 8d. for 40 years	£363 6 8	
Less (£16 3s. 4d. for 20 years)	323 6 8	10 8
	£40 0 0	

Spread over 75 years. An inducement to enterprise.

JOHN E. YERBURY.

THE OXFORD CONFERENCE

AN IMPRESSION.

The Oxford Conference, favoured by brilliant weather could hardly fail, Oxford being what Oxford is, to ensure a great attendance, and though there were rival attractions at Lord's and elsewhere, the attendance was about as much as the hospitalities of the Colleges and the resources of the various hostelries could cope with.

A very large number of members of the R.I.B.A. and its Allied Societies, with a good many accompanying ladies, had assembled in time to flock through the hospitable gates of Wadham before sunset on Wednesday evening, and to put in a punctual appearance at the Vice-Chancellor's kindly and hospitable reception. After an hour's informal *conversazione* in the delightful Hall, in which the conversation indeed formed at times an interruption to the Vice-Chancellor's interesting explanations of the striking historical portraits of Wadham worthies, past Wardens, and royal visitors, the guests, forsaking even the presentments of Christopher Wren and Admiral Blake, made with one accord for the coolness of the Warden's twilit garden. There on the well-kept lawn and under the superb old yew trees they stood in groups, mainly black-clad, but relieved by the glow of cigarettes, the glimmer of badges, the contrasting colours of ladies' dresses, and the occasional hoods of Doctors and Masters of Arts. The members of the R.I.B.A. and their allies appeared to be in no way disconcerted by their general lack of academic dress, though their President made an imposingly academic figure in his M.A. robes embellished by the well-known badge and chain of office. The twilight died away till it ceased to reveal the tender grey of the walls of chapel and hall, beautiful, harmonious and dignified in their seventeenth-century retention of Gothic, with traceried windows illumined, as the guests departed and made their way out into the quiet streets to seek the hostelries of their choice, or the colleges where many of the unaccompanied gentlemen had found most hospitable quarters. So ended the first of the three delightful and most sociable evenings that formed the conspicuous relaxation of a Conference marked by the display of much energy in exposition, in sight-seeing, and in peregrinations.

The Conference, indeed, began formally upon the morrow, when the Vice-Chancellor in full robes and preceded by his bedell bearing the imposing gilt mace, punctually entered Wren's Sheldonian Theatre at 10.30 to take his accustomed seat in the great carved, high-arched, central chair, beneath Streater's queerly painted ceiling.

The company left the theatre about 12 o'clock and dispersed. The more energetic at once began their own inspection of Oxford, while those in search of information or prompted by curiosity invaded the charming headquarters of the Conference in "The High," where Mr. MacAlister and his staff were established in fine be-panelled and be-limneyed Jacobean rooms lent to the Conference by University College.

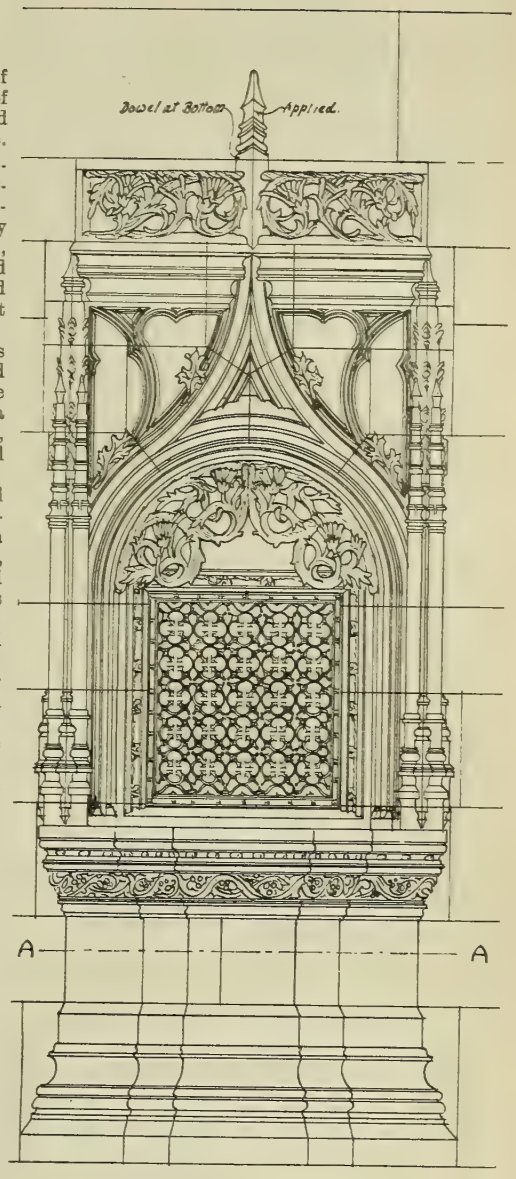
At 1 o'clock the bulk of the party repaired to Magdalen for luncheon in the stately Hall of that College, where Mr. Gotch took the chair at the high table on the dais, below the splendours of linenfold panelling and ancient coloured carvings, between Sir Herbert Warren (President of the College) and Lady Warren. After luncheon the President proposed a cordial vote of thanks to Sir Herbert and the members of his College for allowing the use of their splendid hall, and expressed the pleasure given to the members of the Conference by this permission. Some fifty members, as the total number exceeded the capacity of Magdalen Hall, lunched in Hawksmoor's hall at Queen's College, where Major Barnes presided.

When this contingent had rejoined the main body in the cloisters at Magdalen, the whole were subjected, with Sir Herbert and Lady Warren in their midst, to the discipline of the usual group photograph, the result of which was published in our last week's Oxford issue and is also included in the present issue.

The afternoon was occupied by visits, independent or under the conduct of carefully-chosen guides, to several of the most important Colleges and to some of the University buildings, notably to Magdalen, New, Merton, Christ Church, University, Oriel, Corpus, and All Souls, where Mr. E. P. Warren presided over the Wren drawings in the magnificent Codrington Library.

At five o'clock the various groups and parties reassembled at the Town Hall to be received and entertained by the Deputy Mayor, for the Corporation of Oxford, who had provided a most welcome tea of a generous character, which was highly appreciated by warm and slightly fatigued conferenciers.

A superb evening, with a young moon well up by 8.30 when the members began to reassemble in Magdalen Hall for the reception by the Berks, Bucks and Oxon Association, gave promise of full success for the second night. After a reception by Mr. Warren, as President of that Association, and by Mr. Gotch for the R.I.B.A., while a string band played in the fine Jacobean music gallery overhead, the whole company, including Sir Herbert Warren, resplendent in his red doctorial robes, Lady Warren, and several other Oxonian guests, descended to the cloisters, where chairs and seats had been arranged on the turf-covered garth, over which Chinese lanterns were festooned, while the band, which had preceded the party, was re-established under the archway of the superb Founder's Tower, and long tables of refreshments were disposed in the North Cloister.



Many of the more energetic guests forsook for a while the charms of this extemporised salon, and the seductions of long wicker chairs and ices and strolled over the bridge into Addison's walk, and up to the old iron gates of the Grove, where the dainty little fallow deer came softly and shyly up from the twilight under the gigantic elms to peer at the strangers. But the cloisters drew these adventurers back, with the soft glamour of red globes, under the perfect blue sky where the young moon rode bravely over the square grey tower with its fretted crown of pinnacles and pierced parapet, and over the soft buffs and browns of the stone tiled roofs, while the discreet suggestion of Gilbert and Sullivan's well-known airs from the string band under the archway formed a pleasant undercurrent to the chatter of the groups dispersed over the immemorial Oxford lawn, or clustered round the genial red-robed presence of the College President. The whole assembly under the perfect summer night and in such a setting made an impression of intimate friendliness and restful enjoyment which will not be easily forgotten.

Friday arrived with blazing sunshine, and excursions by road to Faringdon, Coleshill, Fairford and Burford, and by river to Abingdon, and thence to Dorchester. The "sea" trip proved the more popular and Salters' boat was crowded, but the land trip drew some forty guests, who were perhaps especially delighted by the fine old house at Coleshill, new to most of them, and thrown open to the party by the kindness of the absent chatelaine, the Hon. Mrs. Pleydell Bouverie, who had prepared delightful refreshments for the body to enhance the mental and visual attractions of her house and its noble chambers. But the marvellous glass of Fairford and the beautiful church, and the remarkable town of Burford, would have made the fortune of any such trip on such a summer day. The evening brought the banquet in the magnificent hall of Christ Church, which provided a fine spectacle in itself, and a culminating sense of festive enjoyment which was heightened by the charming and persuasive geniality of the distinguished members of the University who were the guests of the Conference, and which found vocal expression in the most amusing and eloquent speech of that accomplished orator the Rev. L. R. Phelps, Provost of Oriel College.

This feast indeed confirmed the impression of the previous day of the charming friendliness and delightful courtesy shown at every contact by the members of the University to those of the Conference, and made of this visit to Oxford, in glorious weather, an occasion the memory of which will long remain.

The sunshine and the glamour of Oxford detained a considerable body of Conference members over Saturday, and a large party visited the Castle and its great Norman Tower, its crypt, and the Mound and Well Chamber, under the guidance of the President of the Berks, Bucks and Oxon A.A. and of the Chairman of the Oxford Society of Architects, while others visited the Library of Worcester and the Inigo Jones drawings, or the Bodleian Library where Bodley's Librarian, Dr. Cowley, showed them some of the principal treasures. Others yielded to the attractions of the Cherwell or the Upper River, and pleasantly disported themselves in punts.

And so ended the Oxford Conference of 1924.

THE LIVERPOOL SCHOOL OF ARCHITECTURE EXHIBITIO

By HAROLD A. DOD.

In opening the annual exhibition of work of the students of the Liverpool School of Architecture, the Earl of Crawford and Balcarres expressed the opinion that popular interest in architecture was growing steadily and consistently, and if well guided would grow intelligently.

Now there can be little doubt that this enlivenment of public interest is due, in large measure, to such exhibitions as this. The first business is to attract the public, and then instruct them. However, to impress the man in the street to the point of getting him to take an intelligent interest in architecture is, one fears, a lengthy business; but Lord Crawford found that he could confidently express the hope that, at any rate, in twenty-five years' time we should regain what people were apt to forget we once possessed, something like a primacy in architecture.

This opinion, coming from so distinguished a source, and in spite of the great strides made recently on the Continent and in America, is well worthy of note. The British architectural student is only too apt to look outside his own country for the best modern work, whether to Stockholm or elsewhere.

If this hope of Lord Crawford's is to be in any way fulfilled it must be by the work of such schools as that at Liverpool, working along definite traditional lines; in their case, the great classical tradition as presented by the works of the great architects of the Renaissance. It is to be feared that the influence of those schools whose scope is not so defined, will not be as great as might be expected.

At first glance the standard of this year's work appears higher than that of the preceding twelve months; a great deal of hard work has obviously been demanded from the students in each of the five years of the course.

The exhibits of the work of the first and second year students show considerable promise and a great degree of care on the part of those responsible for this early stage of training. One must mention here the great value of the isometric projection in helping the young student to think "in the solid," to read plan and elevation as one. Among the second year work the rendered drawing, by Mr. R. S. Head, of a portion of the Temple of Mars, Ultor, deserves notice. It is, however, in the third year that we can look for great developments. After the restrictions of the early years the student is not slow to take advantage of the freedom of this stage.

The schemes submitted under the title "Design for an Orangery," are full of character. Those by Mr. Butling and Miss Dunphy are particularly happy compositions.

The Lever prize competed for this year was won by Mr. Spencely, the subject being a Yacht Club House. Mr. Spencely's plan appears admirable; the elevation is not so good, seeming to lack a feeling of balance, a defect disguised by the very light rendering of the shadows.

The one hour sketches show great skill in the handling of architectural masses without much attention to detail.

The fourth year has produced on the whole the best work in the Exhibition; one looks forward to some very good results from this group in their fifth year. The chief subject exhibited is shown in the designs for "An island recreation centre"; the situation, size and contours of the island being given on a sketch plan. The skill with which the group of buildings called for in the programme was placed island is worthy of great praise. There doubt that the plan adopted by two out three schemes is the correct solution, keep the highest point of land behind the point of the scheme as seen from the ma opposite. Furthermore, the grouping buildings into one mass is much better the extended scheme, the island bein small for more than one point of in The scheme submitted by Mr. Shaw excellent piece of work, well drawn an rendered.

The fifth year work does not appe vigorous as that of the preceding year. scheme for a group of public baths is reminiscent of that submitted in a recent competition, with the addition of large d boxes opening from a corridor outside th hall, a departure of doubtful value fro usual plans.

The best individual piece of work i year is undoubtedly the "Fine Arts Exhi Building in South America," by Mr. B water. It forms a good study in that difficult style—Spanish Renaissance. The c are good, the main dome would probab improved by being finished in mosaic, the smaller domes around it.

Amongst the six hours sketch design standard of which is higher than that more considered works, are a number in c notably the sketch for a public clock b Maxwell, and the water gate by Mr. Cot

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS' CONFERENCE AT OXFORD

On July 10, Dr. Wells, Vice-Chancellor of Oxford University, gave, immediately prior to the lecture by Mr. Warren (the first portion of which we gave last week), an official welcome to the Conference on behalf of Oxford University. It gave him great pleasure, he said, to receive them, although, as they knew, the University of Oxford did not do anything officially for the study of architecture. By officially he meant the holding of examinations. In that respect they were inferior to the sister University of Cambridge, where graduates were allowed to take a certificate in architecture. There was a good deal to be said for that, and perhaps Oxford would come to it; they had at the present moment an active Committee of Fine Arts in Oxford. Up to the present time all the University had done for architecture was to have had the great advantage of employing the services of architects, with the result which they saw around them. Oxford certainly had been well served by their profession, and he especially claimed the right to say that, because he had the honour of presiding over the college which gave Christopher Wren to the University. Wren came up to Oxford in 1649, and resided at Wadham College for two or three years before he went to All Souls, but he had connection with Wadham greater than that, for he returned to the college as Professor of Geometry. As they knew, he was one of the most many-sided of men, and was one of the greatest English mathematicians. He was residing at Wadham College at the time he designed that building; which, as they knew, marked the complete triumph of the classic side of Oxford over the old Gothic traditions which had lasted so markedly, and of which the college in which he had the honour of receiving them was so striking an example. It might seem rather pathetic that there should have been a son of Wadham who completely killed the old Gothic traditions at Oxford of which his college was so striking an example, but he (Dr. Wells) did not think it was pathetic. Probably the time had come when the old Gothic had to pass away, and the new style of architecture in England had been developed. Wren certainly started that in a most magnificent way, and other survivals of the Gothic in Oxford were not so successful as Wadham. As Oxford had gained so much from architecture and architects, it was fitting and desirable that the University and City should have had the honour of receiving the members of that Institute. Two of the greatest names in English architecture at Oxford were Sir Thomas Jackson and Sir Reginald Blomfield. Sir Thomas Jackson was an ex-scholar and now honorary Fellow of his own college, who had very largely rebuilt Oxford, and had represented honourably the great traditions of English architecture, based upon a knowledge of the past and understanding of the requirements of the present day. Sir Reginald Blomfield was also a member of their Institute; a contemporary of his, although he believed he (the speaker) had the disadvantage of being one term senior. Sir Reginald went out from Oxford to forward the cause of English architecture, and at the same time to give them the advantage of his skill there, as in the building of Lady Margaret Hall. So far as the relations of the University with architecture were concerned he felt they certainly ought to do what they could to make themselves familiar with the great traditions of the past. No living art ought to be fettered by the traditions of the past, but at the same time he thought they would agree with him that in all the work done in the present it was as well to take note of the lessons of the past. He thought they in Oxford, not only by example—of which they had plenty—but also by precept, ought to do something to spread a knowledge of architecture amongst their own men. This had always been done, certainly since the Gothic revival, which was begun more or less by the old Oxford Architectural Society, of which at one time he had the honour of being librarian. The Vice-Chancellor went on to pay tribute to the work of Professor Freeman, Regius Professor of History, from whom he learned more of the meaning of architecture in history than from anyone else, and said he seemed to be the type of man they really wanted in Oxford in order that the young men might understand the great heritage they had in the past. What they wanted to bring home to people was the enormous importance of the inheritance which they had. Dr. Wells mentioned in connection with the University's effort to promote the study of English architecture that the lectures given by Professor

Photo: H. F. Traylen, F.R.I.B.A.

Magdalen Tower.

Newton had been well attended, and he welcomed the offer of the Institute to help the continuance of the lectures during the coming academic year.

The President proposed the thanks of the Conference to the Vice-Chancellor, and Mr. W. H. Stucke, of Johannesburg, representing the South African Institute of Architects, seconding, said, if the University should take up and promote to a greater extent the study of architecture, then they could safely leave such matters in the hands of the Vice-Chancellor.

The Vice-Chancellor, returning thanks, welcomed the fact that the vote was seconded by a representative of the British races beyond the seas, for their traditions were the traditions of England. Those traditions in a democratic age had to be maintained.

Mr. E. P. Warren, F.S.A., then gave his lecture entitled: "An Historical Sketch of Oxford." The following is the concluding portion of the lecture:—

The Theatre in which we are assembled, built by the munificence of Archbishop Sheldon, and opened in 1669, was one of Wren's first essays in architecture, and still, as you observe, serves its purpose not unfitly.

Several buildings in Oxford are attributed to him without the warrant of positive evidence, but since it is well known that his advice was as freely given as it was freely sought, it is probable that, in many instances he gave general advice without supplying positive directions or drawings. He appears, however, to have been employed upon work at Trinity College, and the north wing of the Garden Court is confidently attributed to him, and is said to have been in progress before the Theatre was completed.

He is further thought to have advised as to the rebuilding of Queen's College, and to have designed the Chapel and, since Hawksmoor, his pupil and friend, is known to have carried out the Front Quadrangle and its imposing screen and cupola, it is very possible that Wren, who was getting very old (he died in 1723 at the age of 91), gave advice, and, very likely, rough sketches for Chapel and Hall. The old Hall or "Refectory" was only pulled down in 1722, so that it is unlikely that Sir Christopher could have seen the building of the new one.

In regard to the Chapel, more confidently attributed to him, it may be that he had made drawings for this and the Hall, and that Hawksmoor carried out both. The general treatment of the Front Quad, and the Screen completed about 1730, most probably were derived from the great man's inspiration. These striking features, however, so closely resemble in idea Dr. Caius' Court and Gate of Honour at Caius College, Cambridge, which gave to his College a quadrangle with the Chapel forming the north side, dwellings upon the east and west, and the low screen and fine central gate on the south side, planned carefully by the very able and rather meticulous doctor for the admission of southern sunshine, on clearly and emphatically stated grounds of health, that it seems unlikely that the resemblance is accidental.

Dr. Caius had set a new fashion, in the open-fronted College Court. Hawksmoor, at any rate, repeated this form in his Great Quadrangle at All Souls College, next door, but in this instance, his "open" side, with its low central screen and gateway, is of necessity on the west side, and, like all that he did at All Souls, is in the Gothic manner. His queer, thin, but picturesque Twin Towers, which seem to have been suggested by the west front of a church, perhaps by Wren's suggestions for Westminster Abbey, face the screen on the east side of the quadrangle. On the east side of this fine court, and over the central doorway of the Codrington Library, that form its north side, is an indubitable bit of Wren's work, designed by him as a Fellow of All Souls for his college. This is the great sundial which he set up, and which was first put up on the north side of the beautiful and complete little Front Quadrangle, upon the range combining Chapel and Hall.

Hawksmoor's work at All Souls is much criticised, but whatever its merits or demerits, one most conspicuous service rendered by him to that college, to Oxford, and the world, should never be forgotten. This service was to protest against the demolition, actually proposed to him by the College, of the beautiful little front quadrangle with its entrance tower on the High-street, almost all of the fifteenth century and very perfect. He thus resisted the opportunity of planning and building a complete new college. He says: "Whatever is good in its kind ought to be

preserved in respect to antiquity as well as our present advantage, for destruction can be profitable to none but such as live by it. What I am offering at in this article is for the preservation of Antient, durable, Publick Buildings that are strong and usfull, instead of erecting new fantasticall perishable Trash. . ."

He carried the day, and the quadrangle and its tower remain, as you will, I hope, see for yourselves this afternoon.

With this fine achievement, which should ensure to Nicholas Hawksmoor a niche in any future hall of the Society for the Protection of Ancient Buildings, we may, in all honour and regard, bid adieu to his memory, whether or no we agree with Walpole in his dictum upon his work at All Souls, that "the architect has blundered into a picturesque scenery not devoid of grandeur." If he had not won his victory, you would be unable to see several very beautiful and interesting things, that I hope you will see. On the east side of the front quadrangle, and on the first floor, is the elaborate and charming old library, late Elizabethan or early Jacobean, with its fascinating ceiling with "lantern" pendants, its panelling and its heraldry. You will also see the fine little Chapel, its imposing oak screen, and its admirable old glass. The Hall and its pictures, and the very handsome Codrington Library, which contain among its chief treasures a large collection of Wren's drawings. It should be borné in mind that the College of All Souls, or "All Soulen College," was founded by Archbishop Chichele, himself a Wykehamist, in 1437, for the study of philosophy, theology, and law, but primarily and ostensibly as a war memorial, where masses might be sung for the souls of those who fell in the French Wars.

I must apologise if my dates and references seem to come in odd order, but Wren and Hawksmoor have led me to All Souls, and that college not unnaturally to some hint of its origin.

It is easier to trace the origin and dates of foundation of the colleges than those of the University itself, and my temerity, in this presence, carries me no further than the statement that the University of Paris appears to have been, to some extent, a model for those of Oxford, and that, as the University of Paris is thought to have grown from the schools of Notre Dame, that of Oxford may have found its origin in those of St. Frideswide, which appear to have been grouped to the westward of the church of that saint, and therefore to have occupied part of the sites of Christ Church and Tom Quad.

A strong connection with France was a natural outcome of the Norman Conquest, and about a hundred years after that event there seems to have been a migration of English students from Paris to Oxford. There is frequent mention of French speaking at Oxford, and nothing can be more likely than that, under Norman-French dominance, and with a French-speaking garrison at the Castle, that tongue should have been, as it was at Westminster, the common speech of the educated classes.

Mr. Boase, in his book on Oxford, states that a Statute of the Thirteenth Century ordains that Latin should be construed in English and French alternately, lest French be dropped altogether.

What I believe may chiefly interest my brother architects, who are present in such numbers to-day, is the evolution and establishment both at Oxford and at Cambridge, of the typical grouping and form of college buildings, and it seems to me that, as the more ancient University of the two, and possessing, in Merton College, the earliest of deliberate college foundations, and in New College the most typical early instance of carefully ordained architectural grouping, on a well-conceived plan, it is at Oxford that the earliest type may be best studied.

But before considering the matured college

Photo: H. F. Traylen, F.R.I.B.A.

Old House: "The High."

plan, it will be well to give a little attention to the halls of various dates and descriptions which were the precursors of the colleges, but several of which existed as separate corporations, and separate architectural entities until the last quarter of last century, when they were absorbed by Colleges. One, however, remains, as, in plan and general arrangement, a little college, complete with chapel, hall, and library; this is St. Edmund's Hall in Queen's-lane, and upon the south side of the Church of St. Peter's-in-the-East, of the south side of whose churchyard it forms the boundary. It is very well worth visiting, as the one remaining instance of a "Hall" in use as such, and for its individual charm and interest. It was founded, or re-founded, in the latter half of the sixteenth century, but tradition attributes its foundation to St. Edmund in the early part of the thirteenth century.

Halls, houses, or hostels, for they were known by all these names, were the original communal lodgings of poor scholars, and were the natural outcome of mediæval conditions. Bands of poor scholars made their way from different parts of the country, from north, south, east, and west, to seek learning at Oxford. They naturally clung together in a strange town, and grouped themselves round their leader, who, by seniority, superiority of education, or force of character, assumed or was chosen for that position. Thus the position of Head, or Master, under whatever title, filled itself naturally, and the other very necessary official, the Treasurer, purse keeper, or "bursar," to see to the collection and expenditure of the pooled resources of the group, was found in one of its members having the required aptitudes.

These groupings of students, generally formed by young men coming from distant towns or countries, occurred in all countries where universities were established, at Bologna, Salamanca, Paris, and elsewhere. In Paris these groups of students, whose hostels grew eventually into important colleges, were known as "nations," even when they represented other towns or provinces in France—nations of Picardy and Normandy as well as of England, Scotland, and Ireland. The same system obtained amongst the Knights of St. John of Jerusalem, in their establishment in Malta, where the hostelries, which grew to be rather magnificent buildings, were known as "Auberges," or inns, like our own Inns of Court, and where the different nationalities were known as the "langue" or language of France, of Italy, of Castille, etc.

In Oxford, probably in imitation of Paris, the scholars were divided into nations, northern and southern, with proctors to keep order, and the respective nations were careful, as Mr. Boase tells us in his excellent book of the Historic Towns Series, that one of these proctors should always be a south and the other a north countryman. The Irish and Welsh, he says, usually sided with the Southerners, and the Scotch with the Northerners, and that "in 1389 the Northerners sacked several halls and much ill-treated the Welsh," while you may be surprised to learn, from the same source, that "in 1401 the Irish had a riot of their own, and they were mostly banished in 1422."

The earliest Halls were sometimes mere assemblages of students in any obtainable lodging, or, in many cases, in an inn. As time went on, some of the more numerous or richer groups managed to acquire stone houses, mostly built by the Jews, as before stated, and roofed with the stone tiles, which are the characteristic and beautiful roofing material in Oxford, but which, alas! have, in view of expense, yielded place enormously of late, to red tiles, or the abomination of purple Welsh slates.

These Halls were, of course, at first, merely ordinary dwelling houses, small, and roughly adapted to their use by the students. A kitchen, a common room for meals, and a few bedrooms or a loft capable of use as a dormitory, were usually all they had to boast, or all indeed that was demanded of them.

They were usually known by names derived from their external peculiarities, or from their position, their owner's, or the patron saint of a neighbouring church. There were such names as Broadgates Hall, Angle Hall, White Hall, and Black Hall, the last still existing, in name at any rate, in a fine seventeenth-century house opposite St. Giles's Church, in the wide street to the north known as St. Giles's. Chimney Hall, as says Cecil Headlam, to whose "Story of Oxford" I am indebted for such information about these Halls, "recalls the days when a large chimney was a rarity." Many Halls retained the names of their owners, like Peckwater's Inn, formerly on the site of Peckwater Quadrangle at Christ Church; others from the signs of the inns in which they were first established, or the signs they had adopted for distinction, and had hung over their doors, such as The Brazen Nose, the Eagle, the Elephant, the Saracen's Head, and the Swan. Of the existing inns, the Clarendon was built on the site of an old inn or hall known as the Star; the Roebuck was once Coventry Hall.

These halls or hostels, in the process of time, as the University gathered power and prestige, and as the benefactions of rich, benevolent and influential men, who valued, and were eager to promote learning, were attracted to Oxford, were perceived to be insufficient, and the deliberate foundation and building of colleges naturally followed.

University College claims, and apparently with justice, to be the earliest of University endowments. At first known as The Great, or Mickle University Hall, it had a north country connection, and was endowed in 1249 by William Archdeacon of Durham. Statutes were granted to the Hall in 1280, which I

suppose may be taken as the date of incorporation. At first established on the north side of the High-street, moved in 1332 to its present site on the southern side of that street, where its fine long and homogeneous front, though it is not all of one date, adds immensely to its character and dignity.

Merton College was founded by Walter de Merton, of Merton, in Surrey, a man of great ability and distinction, sometime Chancellor to Henry III, and Bishop of Rochester, from whom he obtained a charter in 1264 to incorporate his establishment of Scholars of Merton, at Malden in Surrey, into an independent society. Later, in 1274, he transferred this establishment to Oxford to its present site, purchased from the Abbey of Reading, and incorporating the parish church of St. John. His intention was to provide means of maintenance for poor students, and their education for the service of Church and State, and he drew up careful and exact rules for the governance of his College. He banned all monastic influence, no monk or friar was to be admitted on his foundation.

Of the first buildings of Merton College little now remains. Some of the carving over the College gateway, the great north door of the Hall, and perhaps the Treasury, and part of the Sacristy. The noble Chapel, the Hall, and the incomparable Library, as well as the charming inner quadrangle known as Mob Quad., are all of later date. The choir of the chapel dates from the end of the thirteenth century, the transepts begun apparently in that century or early in the fourteenth, but were not completed till the fifteenth, while the fine tower was finished in 1451. The Chapel seems to have been planned as a cruciform church, with nave, transepts, and choir, but the nave was never built, perhaps in imitation of the plan of the Chapel of New College, which, though begun much later, was finished earlier.

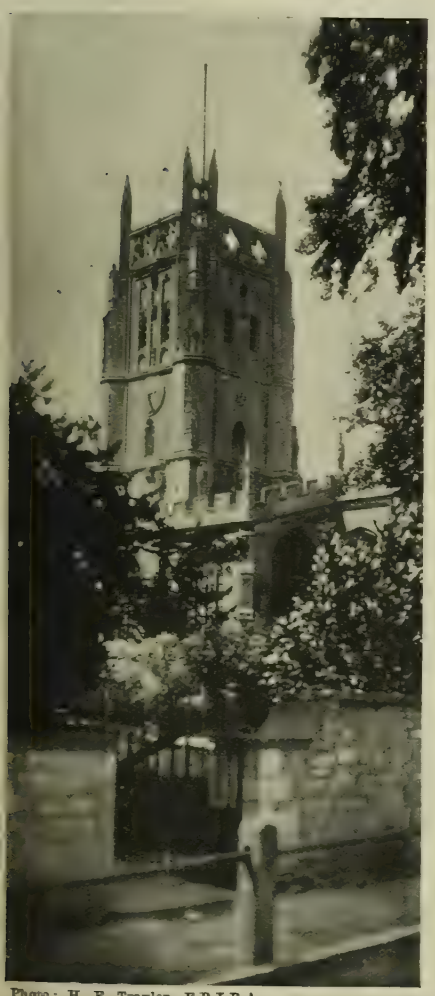

Photo: H. F. Traylen, F.R.I.B.A.

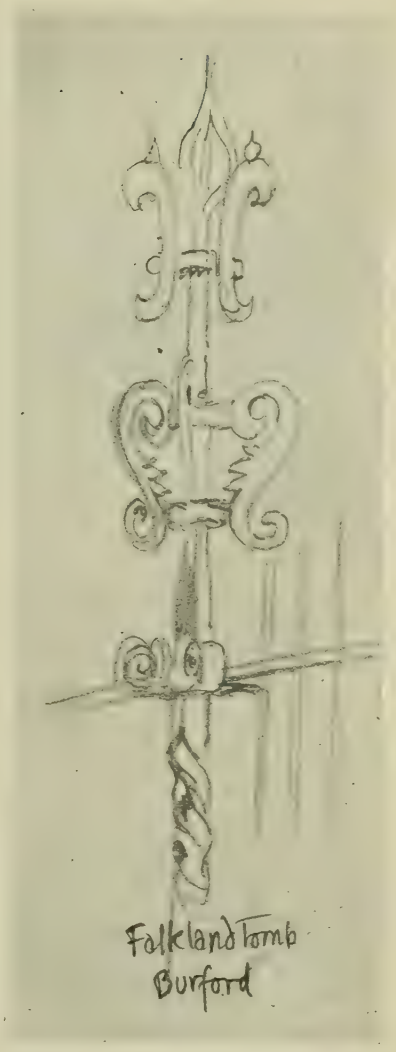

Fairford Tower.

Merton College, albeit possessed of extraordinary charm and beauty, is not a typical college, as we understand that term. Its planning is irregular and not deliberately evolved.

Its nearest contemporary, or immediate successor in date of foundation, Balliol College, founded in 1266, possesses no buildings coeval with the earliest of Merton, and was upon a smaller scale; it still possesses its old Hall and Library, and a very beautiful Oriel window, all of the fifteenth century, but beyond the plan of its front quadrangle and entrance, which is of the accepted college type of the fifteenth century, it has been so much rebuilt and modernised that it neither conveys the effect of its antiquity nor its original disposition.

As a nobly conceived and nobly executed group of College buildings, finely planned and finely built, the New College of St. Mary de Winton, commonly called New College, founded in 1379 by William of Wykeham, Bishop of Winchester, presents, as I think, the most perfect type of the mediæval college, and one of the most remarkable instances of adroit and supremely dignified use of an irregular and somewhat difficult site to be found in, or out of, this country. I speak of the original buildings of the founder. The beautiful front quadrangle was badly marred in the seventeenth century by the clumsy addition of an additional story to the long, low fourteenth-century buildings, and the high northern range of chapel and hall have suffered in consequence by the alteration of scale thus occasioned. But they are noble buildings in themselves, albeit somewhat mauled by Wyatt and Scott. The charming little cloister, with its chestnut-timbered roof, its garth intended as a cemetery for the Society, the admirably proportioned bell tower, on the rampart line, the Warden's Lodgings, the simple and dignified College gateway, and the bold and charming device of the arched wing of the lodgings, carried over the lane to increase building space and form a bridge for the Warden to his garden and to the noble Tithe Barn which faces the long stable buildings on this northern side of the lane, are all intact, or so little touched that the sense of the fourteenth century seems to linger about the grey old walls.

Intended by its founder as a senior college or secondary school to his college at Winchester for younger scholars, Wykeham achieved at once two great educational ideals: he founded together a model college and a model public school, both housed in noble buildings. He was a most remarkable man, astute, practical, a great man of affairs, and with a sure instinct for architecture, fostered no doubt by his early contact with the crafts and some early practice in business by his juvenile experiences. Born the son of a carpenter at Wykeham, he was educated at a grammar school, and subsequently in a notary's office. He was sometime supervisor of the King's Works at Windsor, where, it may be presumed, he learned architecture. Oxford owes him much; his college became a model in many respects, architectural and other. His conjunction of public school and college was copied by Henry VI in his linking of Eton with King's College, Cambridge, and later by Sir Thomas White in linking his College of St. John with Merchant Taylors' School, while his architectural conception of a college was largely imitated at Oxford. This is conspicuously the case in respect to the Chapel plan, adopted by so many of the subsequent College Chapels, of the long collegiate or monastic choir, screened from a short nave arranged for four altars, but large enough to form an ante-chapel, capable of being used, as before the Reformation it frequently was used, for lectures and disputations. His placing of Hall and Chapel in one continuous range, as the side of a quadrangle, you will find in several other colleges. It is observable that at New College the high range of Chapel and Hall is placed upon the north side of the Quadrangle, the best position, as, while shutting no sunshine off the quadrangle, it receives full sunshine itself on its southern flank.

Time, and your patience I fear, will not permit me to describe or even to mention more than a very few of the other fine colleges of Oxford, all of which are interesting in their degree, and most of which, indeed, have interest and beauty of a very high order. I must, however, and on every account, say something of Magdalen, where the adroit use of an unusually beautiful site, the happy adaptation of the existing buildings of the Hospital of St. John, and the proportionate scale and beautiful detail of its mediæval buildings, and the very dignified range of the early eighteenth century known as the New Buildings, make a college group which, with its 100 acres or so of deer park, great trees, wide garden and river walks amid the windings of the Cherwell, make of Magdalen a collegiate pleasaunce unlike anything else in the world.

Like New College, it had a great, energetic and rich founder in William of Waynflete, Bishop of Winchester and first Provost of Eton, who founded the College of St. Mary Magdalen about 1448. The long southern front, aligning the roadway between the site of the old East Gate and the Bridge, stands upon and incorporates parts of the buildings of the Hospital of St. John, and contains, in a blocked doorway still in evidence, the dole-gate where doles or food were handed out to pilgrims or the poor.

The fine bell-tower, whose proportions give it a greater apparent height than it possesses —it is only about 120 ft. high to the top of the parapet and 140 ft. to that of the pinnacles —was begun about 1492, and took eleven years to complete. The design appears to be so perfect as it stands that it greatly surprised me, when entrusted with its repair some dozen

years ago, to find that the very effective octagonal angle buttresses were not originally intended, the quoins of plainly finished angles existing behind them. This shows that the whole design of the noble crown of pierced parapet, angle and intermediate pinnacles, could not have been part of the designer's first intentions.

The most remarkable cloisters, with their buttresses, symbolic figures and grotesques, were evidently built on the mediæval model, but without intention of the mediæval use, as a place for exercise and meditation in the open air, but rather as a convenient covered passage of connection, around the new fashion of quadrangle, between the various parts of the College, the Chapel, the Hall and its offices, the President's Lodgings, the Library, and the various chambers and dwellings of the College, and as the main body of the College, the intended entrance being by the door in the superb Founder's Tower, the old, irregular quadrangle of St. John remaining as a sort of fore-court.

The delightful Grammar Hall, on the west side of St. John's Quadrangle, is a relic of the former foundation, and the most effective and proportionate buildings between Tower and river, though thoroughly Gothic in type, were not added until later.

The "New Buildings," across the wide garden to the north of the Cloisters, were put up in or about 1733.

The latest addition of St. Swithun's Quadrangle was built in 1882, from the designs of Messrs. G. F. Bodley, R.A., and Thos. Garner. The Quadrangle, however, has never been fully completed.

It will be observed that the New College plans of forming one side of the quadrangle, by placing the Chapel and Hall end to end, under one roof, was copied here, and that the short nave or ante-chapel, of which that College had set the fashion, was here observed.

Magdalen has always maintained a strong connection with Winchester, whose bishop is the Visitor of the College, and with Eton through its founder; but it has three schools for boys of its own, one at its gates, one at Brackley, and one at Waynflete.

I can only briefly mention one other College, of a later date and of conspicuous interest and beauty—the College of St. John, in the broad street known as St. Giles', and, like Magdalen, outside the city walls.

Again like Magdalen, this College was built upon the site, and incorporated part of the buildings of an older foundation, the suppressed College of St. Bernard, founded in 1437 by Archbishop Chichele for the Cistercian monks of Rewly Abbey, dissolved by Henry VIII.

Brazenose Knocker:

Bought by the College with the property at Stamford, 1901.

The College of St. John Baptist was founded in 1555 by Sir Thomas White, Merchant Taylor, and twice Lord Mayor of London, and preserves in the range which forms the west front, with its Tower Gateway, a portion of St. Bernard's College, together with the interesting forecourt enclosed by low stone walls, with a heavy weathered coping. St. John's being the only College to retain its external forecourt intact, though Balliol, upon the evidence of eighteenth-century prints, retained one until far into that century, and Wadham retains the form, but fenced with modern railings. St. John's presents, in plan, no unusual features. It accepted the admitted type, but in proportion, charm of design and of detail, as well as in the beauty of its garden, it has its own extreme distinction. Its Hall and its Chapel, 1502-1530, placed wisely on the north side of its first quadrangle, like those of New College. In the inner or Canterbury Quad, which was completed about 1636, it has semi-classical colonnades, and a magnificent central "frontispiece" with admirable bronze statues of Charles I and Henrietta Maria. The colonnades, as a convenient college adjunct, may have been suggested by the arcades of Magdalen cloisters. The College is, of course, indelibly associated with the memory of Archbishop Laud, President of the College and sometime Chancellor, whose distinction of taste, scholarship and conspicuous loyalty are reflected in the beauty of the Canterbury Quad, whose name commemorates his Archbishopric, in the rich and handsome Library, in the royal statues, and in the extreme beauty of the east or garden front of this remarkable college.

Burford Priory; Eastern Front.

From a Sketch by Lieut.-Col. H. P. Cart De Lafontaine, A.R.I.B.A.

I cannot trespass further upon your time and patience, but I am sure that those of my audience who have already seen something of Oxford, and you will all, indeed, be of that number by this time to-morrow, will admit the impossibility of conveying anything further than the merest suggestion of its architecture, as illustrating its history, and of its history as explaining its architecture, within the limits of even a longer paper than mine.

May I end by expressing the hope that those of you who are here for the first time may carry away the happiest impressions of your visit, that those others to whom Oxford was already known may find, as I have always found, that her charm ever increases, and her interest never fails.

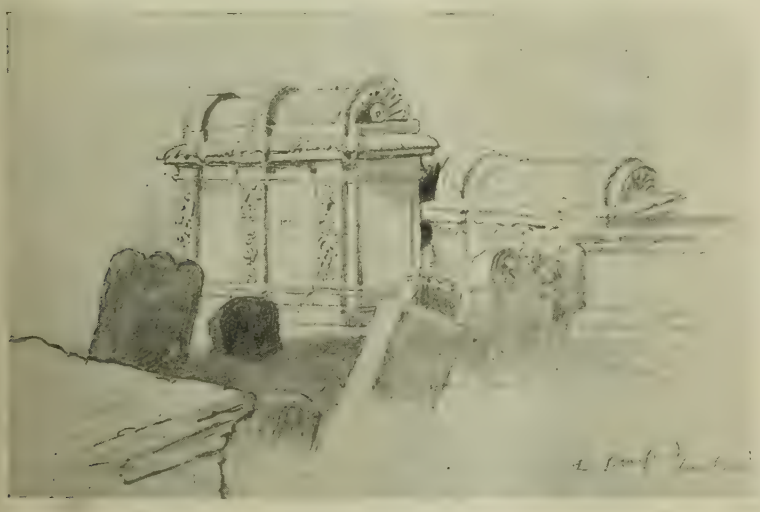
Mr. John Keppie, President of the Incorporation of Architects in Scotland, proposed a vote of thanks to the lecturer, which was seconded by Mr. Percy Thomas, President of the South Wales Institute of Architects, and Mr. Warren briefly replied.

The delegates partook of luncheon at Magdalen and Queen's Colleges, and were photographed in the gardens of Magdalen College. The photograph was given in our Oxford edition last week, and is included this week as an inset plate. The afternoon was spent in personally conducted visits to various college buildings.

In the absence of the Mayor, the Deputy-Mayor welcomed the members of the Conference at the Town Hall in the afternoon. He said much had been said and much written with regard to Oxford and its architecture. It had considerable interest for the members of the Institute, and he was sure they would be amply repaid by their visit.

Town Planning in Oxford.

Mr. Raymond Unwin then lectured on "Town Planning in a City like Oxford." In the course of his remarks he said Oxford was not alone in that its town-planning problems were peculiar. Every city had its own special conditions and needs. One might say of each great city that it had a character, almost a personality, of its own, which the town planner should seek to preserve and develop. But of few cities were the special circumstances so important, and the character so unique, as in the case of Oxford; consequently they should be a dominating influence in the planning of the city. There were university cities in which the town was so large and important that the university exerted little appreciable influence on its development; there were others in which the town was so small that its chief function was, and was likely to remain, that of ministering to the material needs of the University. Oxford was in a different position. Here the city was the older partner; it had a long and honourable history. On many occasions it had been chosen as the seat or refuge of the English Parliament. Before the University was constituted the town had intimate connection, almost on a footing of equality, with the City of London. The City Fathers had been brought into relations of special loyalty with several of the Kings and Queens of England. The town had, indeed, a life history and a personality of its own. At the same time, its relation to the great University, which had an equally glorious past, and an even more world-wide reputation, had been one of the greatest interdependence and intimacy, not always free from strain or jealousy. The ties which united the two resembled, perhaps, the



nion and the bonds of matrimony. The roblems of their mutual relations and their ights were at least not unlike those of two narried people, each of whom had a strong ndividuality and was inspired by the honour- ble desire for a personal career. Such a re- ationship would not be permanently har- nonious on the basis of the subordination of ither party, but only on that of mutual espect and understanding, on a right appre- iation of the importance of the different func- ions which each had to perform, and a due cceptance of the limitations which their re- ationship and their deper dence on one an- other must impose on both alike. When they considered that that dual life of such excep- ional interest and value was housed in and bout an ancient city, which, as a mere col- ection of buildings of interest and beauty, onstituted one of the greatest and most highly rized treasures of the world, they would egin to realise something of the difficulty, nd something, too, of the fascination, which he preparation of a town plan for Oxford and he surrounding lands presented. In the joint orking out of that plan, they might confi- ently hope for a further advance of that utual appreciation between the University nd the city which had already made so much rogress, since the time when T. H. Green, f Balliol, made the encouragement of good nderstanding between those two bodies one f the aims of his life. They confidently ex- ected that in making their plans University nd municipality alike would cheerfully recog- ise the duty which they owed to mankind preserve from injury the unique beauty of he city which they had jointly inherited. haring the respect and affection for their ommon home, they might be relied on the ore willingly to put up with such compara- ve inconvenience as might be necessary to onserve its character. As it became urgent solve the problems which progress brought p—problems of congested traffic, of expand- g commerce, of modern requirements in nitation, and the like, before adopting any olution dangerous to the existing beauty ey would search diligently for alternative ethods, seeking each time to find the way ut of or round their difficulties which would est harmonise with the *genius loci* so highly easured. He wished to congratulate the ity Corporation and their officials on the eps already taken. Instead of being content ith a small scheme for the unbuilt-on area ithin the city boundaries, they had taken a ore adequate view of the area which was timately bound up with Oxford, and had alised that the built-up centre of the city as vital to the scheme. Authority had now een given by the Minister of Health for a heme to be prepared for practically all the nd within a radius of three miles from arfax. At no distant date a preliminary statement of the proposals would be called for. It would be realised that town-planning on this scale was no mere scheme for developing a few housing sites, as some seemed to think. On the other hand, it was no scheme for stereotyping in detail the planning of all the sites within that vast area. Nor was a town-planning scheme a preliminary measure to the enlargement of the borough boundary; on the contrary, while it secured co-operation in planning, it left full autonomy to surrounding authorities in administration. Town planning was, in fact, the application of imagination, skill, and foresight to direct and guide the future development of the area, instead of leaving it entirely to the mercy of the haphazard play of individual interest or caprice. It consisted in looking ahead, studying the growing requirements of the district, foreseeing the dangers which threatened, and making a general plan of the main lines of development which would best provide for the growing needs, and avoid danger to the existing city. Increasing traffic he imagined to be one of the most threatening dangers. They shared this difficulty with all modern cities, but whereas most of them were still obsessed with the importance of providing more and more facilities for an ever-growing volume of movement, they, he hoped, would first seek to discover how far it might be practicable to abate the swollen stream which already threatened to flood their central area. They would inquire whether some of it might be directed into new channels, and so carried harmlessly round the threatened district. Even more important, they would study how needless movement to and fro might be reduced by a better location of the people and the places to which they chiefly resorted. For this purpose they would investigate the various causes of traffic congestion and the way in which they might be controlled. The increasing multiplication of motor vehicles of all kinds was one of these causes, of which they in this country had not yet experienced the full force. It was well to realise that already in America there were cities in which the multitude of motor-cars in use afforded seats for the whole population, who could thus empty the city and all go riding at once if their roads would accommodate them. In view of the necessity of limiting the volume of traffic in the central area, the question of diverting as much as possible along by-pass roads was of special importance when planning any new roads at Oxford. It was important, for example, that through traffic from the north, as well as that between the northern suburbs of the town and those east of Magdalene Bridge, should be enticed from passing through the centre of the town by the provision of alternative routes. Equally important was it to improve communication between that part of the town which lay north of Broad-street and the railway stations, or the towns and villages which lay beyond them. Such traffic should be discouraged from coming further into the town than Beaumont-street. Owing to the position of the rivers, parks, and other features obstructive to road-making, the planning of these highways was not without considerable difficulty; but if Oxford continued to grow their advantage would be increasingly realised, and he was confident that they were justified in making great efforts to preserve the best possible routes for these roads. They need not be too much deterred by the fear of costly bridges; they were apt in modern times to forget or to despise the humble ferry, which was still so effective a substitute on many a wider river. Where on their projected roads the cost of a bridge might not be justified, a ferry might prove a very serviceable substitute for many a year.

Apart, however, from planning or making new roads, there were other means which they could take to check the growth of centralised traffic. In this country they had not yet general town-planning powers applicable to the built-up areas of their towns; but in Oxford they had such a unique collection of special buildings, of historical interest and of beauty, that practically the whole of their central area had been deemed to come within the clause passed to meet such exceptional cases in the Housing and Town-Planning Act of 1923. While the powers conferred by this clause might not enable them to do all that might ultimately be found to be desirable, they did carry them a long way, and included among other things the regulation of the

Coleshill House.

In Burford Churchyard.

height and character of buildings. He would ask them to consider carefully how far they might be able to use these powers to prevent an increased density of building in the central areas; to check the increased occupancy of sites for business or other purposes which would stimulate traffic in the centre; and to limit the heights of buildings on sites already occupied for business purposes. It had not been sufficiently realised how greatly the increase in height of buildings added to the volume of traffic in the adjacent streets. This was brought home to one very forcibly in studying American conditions, where one might find the population of a small town occupying one lofty building and owning among them over 1,000 private motor-cars. He did not, of course, anticipate such extreme conditions in Oxford; but might they not ask those who were fortunate enough to have business premises in the central area of Oxford that they should accept reasonable restrictions in regard to any further increase in the size or height of their buildings? This, he was convinced, was one of the most important of all the precautions which could be taken to avoid increasing congestion in the city.

Continuing, Mr. Unwin said what was true of the vision of the city, as a whole, was true also of many charming vistas within the city. Much might be done to preserve these and to protect their setting. It was not enough in this respect to have regard only to the buildings of outstanding merit—the colleges, churches, and the like. These might be preserved in themselves and yet be largely destroyed by replacing the harmonious background of simple but charming buildings, which were so common at Oxford fifty years ago, by blatant or merely incongruous examples of the modern lack of taste.

They were there as a gathering of architects. It was the peculiar function of the architect to unite the useful with the beautiful, to study scientific construction, to consider the practical requirements, and to satisfy them in beautiful form. He knew of few activities in which this specially trained imagination was more needed than in town planning and city building. And they should be agreed that there were few cities in which this need could be stronger than in Oxford. He was glad to think that this was well understood by the Corporation and their able officials, who had already made so auspicious a beginning of the town-planning scheme. There was, of course, equal need for the experience and knowledge of the engineer and surveyor and for the student of the economics of land development. Each had scope and work of importance enough to satisfy their greatest ambition in such an opportunity as this city afforded. From what he knew of the councillors and of the city engineer, he should be surprised if they did not amply recognise the need, and cordially welcome the help which could be given by the experienced architect in forming a complete scheme. With such co-operation, while preserving the old and cherished heart of the city, it should be possible to lay out and design new quarters for the expanding population, their business and their play, which would be as attractive as convenient.

A vote of thanks was passed to the lecturer for his instructive discourse.

The Excursions.

Of the two excursions suggested for Friday the attractions of the river drew the bigger following. The flock, well over a hundred, lacked an official shepherd, but it succeeded in fulfilling its destiny without casualties. Perfect weather and the placid pace of the *Queen of England* were in accord with the serene beauty of England's river. At Abingdon the party lunched in a room adjoining the Abbey gateway, which had been lent by the Corporation. Very little is left of the original buildings, but the Corporation is fortunate in its home, and still more in the fine collection of pictures, including two Gainsboroughs and a S. Sebastian attributed to Van Dyck. Abingdon is essentially the protegé of patrons, and the sense of public spirit permeates the town. There are several delightful old almshouses, with quaint endowments, and fine details presented by benefactors, while St. Helen's Church reveals the same personal touch in numerous monuments, not omitting that to William Lee, who died aged 93 years leaving "in his Lyfe Tyme issue 200 lacking but 3." The monument habit is, however, less happily expressed by some of the appalling windows of the last century. The church has five aisles, and the elegant columns supporting the arches are curiously reminiscent of the forest. In the market-square the seventeenth-century Town Hall is a contribution by yet another generation, and is a further proof of Abingdon's good fortune. The second half of the river trip ended, after tea on board, at Day's lock, and the party reached Dorchester by a trek across the sun-kissed desert. At Dorchester in the interval before the arrival of the 'buses there was another church to visit. Probably even architects will confess that old churches can become a pious pilgrimage, and it is a sincere tribute to the Abbey Church of Dorchester that its appeal is so dramatic and distinctive. Bare and lofty, its general character has the quality of a cathedral, while the beauty of the east and north chancel windows is positively startling. The huge central pier of the east window holds the two sidelights like a rock, and was presumably intended as a support for a groined roof. It is not possible to linger over the many delightful details, including a lead font, because on the return journey Bus No. 3 displayed an enterprise of its own and gave its occupants a glimpse of Iffley Church. If the message of Dorchester is highly spiritualised, that of Iffley is elemental. The church is small and strong and the architecture is not consistent, but the sincerity of its Norman builders, their love of mass and plain surfaces, are the origins to which our modern church builders are returning. For this reason many of those fortunate enough to have seen it for the first time will rank Iffley as the gem of the day. In saying this, let us not forget the tulip tree in full bloom, with orange-flecked cups, that stands as a sentinel beside it; nor shall we prejudge what 'buses 1 and 2 thought of our pleasant deflection.

Motor Excursion.

Both excursions were so attractive that it was difficult to choose between the river and a motor trip through some of the most delightful scenery of the district, with the prospect of seeing some interesting architecture in addition.

The motor trip took us first over Cumnor Hill, whence a magnificent view of the district was obtained. From this point there was a long descent until our first halt at Faringdon, a picturesque village in the Vale of the White Horse was reached. Here a visit was made to the church, which contains some fine tombs and a good piscina. The most remarkable features, however, are the early twelfth-century wrought-iron hinges to the south door, which are still in a good state of preservation, owing to the fact that (until the last century) this door was protected by a porch which was cleared away during one of the "restorations," as it was not considered to be in keeping with the church.

Our next halt was at Coleshill House, too well known to require detailed description; during our inspection the question as to who was the architect was debated, as, although the house is described and illustrated in a standard work as being the work of Inigo Jones, later investigations would seem to cast a doubt on this attribution. Personally, we are inclined to think that the owner (in a manner not unknown to Inigo Jones' modern successors) wrote and told his friends that the design was his, and that he had "that clever fellow, Jones, to put my ideas into shape you know!" He may or may not have entrusted the actual execution to a relative, as is supposed to have been the case. An inspection of the building tends to confirm the latter theory, as although the plan and proportions of the hall and reception rooms are excellent, the detail—particularly in the case of the elaborate plaster ceiling—appears somewhat heavy, and is everywhere laid on with such a generous hand that it produces

Photo: H. F. Traylen, F.R.I.B.A.

Fairford Porch

restless and unsatisfactory effect. The dining room is another problem, as the walls are panelled in oak with pilaster strips, etc., of Jacobean type. Presumably this panelling was removed from an earlier house and re-erected here at a later date.

Proceeding on our way, we passed through Lechlade, and had time to record a snapshot mental picture of its picturesque roofs and curving street before, some miles further on, we halted for lunch at Fairford.

St. Mary's Church is probably the most complete example of the English parish church of late mediæval times which now exists. One of the remarkable features of the building is the (almost) complete set of fifteenth-century painted glass windows, of which the most curious is a series (in the clerestory window of the north aisle) representing persecutors of the Church. Here, in the smaller tracery lights, are representations of small devils in place of the angels which accompany the figures of the martyrs on the south side. The high altar was designed by Mr. J. N. Comper, and an attractive altar with carved triptych and hangings in the north aisle is the work of Mr. Geoffrey Webb.

From Fairford our route was homeward, the first stopping-place being Burford. This village is certainly one of the most beautiful in Oxfordshire, and the wide main street descending steeply towards the centre of the clustered group of gables, high-pitched roofs and varied chimney-stacks, with the graceful tower and spire of the church appearing above some ancient elms on the right, forms a picture of typically English beauty. Space does not permit of any detailed description of the church, which was first visited, after which members of the party went their various ways in search of architectural beauty. Unfortunately, we were not able to visit Burford Priory, a fine house well restored in a beautiful setting, but a distant view of the entrance front made us envy the fortunate owner of so delightful a retreat. All too soon the warning whistle called us for an excellent tea, and we once more climbed into our motor coach en route for Oxford, which was reached shortly after six o'clock.

Much of the success of this excursion is due to the information so kindly given by Messrs. E. P. Warren (President, Berks, Bucks and Oxon Architectural Association), Rogers, Rayson (Chairman and Hon. Sec. of the Oxford Society of Architects), and Harry Hutt (Hon. Sec., Berks, Bucks and Oxon Architectural Association), to all of whom our sincere thanks are due.

Photo: H. F. Traylen, F.R.I.B.A.

Almshouses, Burford.

THE BANQUET.

On Friday evening a banquet was held in Christ Church Hall, the President presiding.

After the loyal toasts, the President proposed "The University and the City of Oxford," and said the Institute Conference had never been held in such a fascinating centre. At the Conferences their aim had not been so much to discuss matters of high importance as to confer amongst themselves as friends, to draw closer the bonds of unity. Although the face of Oxford remained on the whole much as it had done for many centuries, yet he fancied that they had done something to alter its appearance, and whether their interference was not visible even in the old colleges and those old façades which had apparently not changed for many years, there still seemed when one visited them after a lapse of years a sort of change, a kind of subtle alteration which might arise from the buildings themselves or might arise from the eyes with which they viewed them. However hurried the life of Oxford might be becoming, whatever new problems faced the civil authorities, they felt confident from what they had seen in Oxford that the authorities would regard the great heritage over which it presided with infinite respect and infinite care.

The Rev. R. L. Phelps, responding, said to do so was a great responsibility when he was asked to, and in a sense, represent the Vice-Chancellor. He felt that the most careless undergraduate, although he had not perhaps thought upon the subject, although he had not thought of the stream-like winding of that glorious street, High-street, although he had been deaf and blind to all the charm of Oxford, what he did carry away was a vision of architectural beauties of that kind and another. Thanks to those represented there that night and their profession, they had most abiding memories of Oxford. When they came to consider its buildings there was something of the same mystery, something of the same lack of certainty, that there was with regard to the University. Who could tell who was responsible for many of Oxford's finest buildings? Take his own college. The front quadrangle of Oriel College formed one of the beauties of the place. Who was responsible for it? There was no name of an architect connected with it, the college accounts did not show that anyone carried it through, it was thought out, he took it, by the craftsmen who executed it with their own hands, and what was true of that was true of many buildings. They heard disputes over work attributed to Wren, how far Inigo Jones worked in this place, and the history of the Ashmolean. He thought those who were comparative strangers had not noticed the extent to which Oxford drew from all four quarters of the globe. They looked for something which would unite the diverse elements which came together from all quarters of the Empire, and they found nothing more calculated to do so than the stone walls which made the city of Oxford, its colleges and its buildings. It was to them and those who had gone before that they owed what was in the present, and would be still more in the future, one of the strongest bonds which united the members of the different parts of the Empire who came to Oxford. There was a great deal which they had done, and which they would do in uniting districts far apart, but even more difficult work was to unite the present with the past. Of all other links that could make appeal to the sense there was none which could equal Oxford's architecture. The architect had a great work before him, for he had to unite the aims, the ideals of the present with the aims and ideals of bygone generations. That was his task above all in Oxford. It would not be gracious to ask how far the present generation had succeeded in discharging that task. Oxford had suffered through the amateur architect, but they owed to architects no small debt in the past. That debt was ever increasing, and when he expressed the gratitude of Oxford for their work, their gratitude was at the expense of favours expected.

The Mayor of Oxford also responded.

Sir Herbert Warren, K.C.V.O., in proposing "The Royal Institute of British Architects and its Allied Societies," said Dr. Johnson was a sort of crowning incident of his career that he should be invited to dine in Christ Church Hall, that splendid hall which he (the speaker) always considered to be the most splendid chamber in Christendom. He had no doubt that a Magdalen man, Cardinal Wolsey, was the founder of Christ Church, but he did not know they had heard much about Wolsey as an architect. Wolsey was also the architect of Magdalen Tower; certainly in that splendid hall in which they were met, the kitchens, and also of Hampton Court. They could claim that he was one of the great architects of England. What constituted an architect; what was the function of the architect? The great architect must be a man whose art must cover the whole gamut of human interest, cathedral, palace, hospital, law court, the university college, the laboratory, the library, and above all, the home. He had to give it a perfect or as nearly possible a perfect form, and make it suitable to all the needs of life. It was a great task and a great calling. He coupled with the toast the names of Mr. Gotch, Mr. E. P. Warren, and Mr. Paul Waterhouse.

Mr. Paul Waterhouse, who responded, said if he had got to give a message to Oxford, let him say, as a man in the street, to the people who said Oxford must bring itself up to date, "don't take those things to heart." If Oxford went out of business as an old-fashioned place of business, let others take on the job; don't let them try to emulate the Universities of the north, don't try to emulate Cambridge, don't let them even become as Bletchley.

Mr. E. P. Warren, also responding, said there was no Society more loyal to the Institute than the one he represented, and he felt that as it represented three counties, each of which was represented by a conspicuous establishment, it had some distinction. Berks claimed the castle of Windsor, Bucks one of the most beautiful public schools, while Oxon claimed the beautiful city of Oxford and a great University. The speaker paid a tribute to the Presidency of Mr. Gotch, and speaking of the work of the Institute, said wherever the British flag flew, the Royal Institute of British Architects was in greater or minor degree represented by architects. They all showed the greatest possible loyalty towards the Institute. So far as that Conference was concerned, it was impossible for them to leave Oxford without acknowledging in the fullest and warmest manner the debt which they owed, the debt they would feel for years to come, towards the University and City for the facilities they had been offered and met with. That Conference had not been carried out without a good deal of work, and might he be permitted to ask for consideration of the efforts made by the Executive Committee and by the Chairman of the Oxford Society of Architects (Mr. Rogers) and the Hon. Secretary (Mr. Rayson), both of whom had been responsible for the arrangements locally, and further by that prop of the Royal Institute of Architects, Mr. MacAlister. Oxford was always inspiring to architects, but he was sure every architect who had attended the Con-

ference would hope that the University would, in the erection of new buildings, consider its dignity, and the expression of that dignity, as it had done in the past, and that it would most carefully watch the preservation of its beauty, and would not allow the mere consideration of rapidity of travel and the like to injure its amenities, and that it would not consider any form of advertisement, for Oxford, like good wine, needed no bush.

The Conference owed much of its success to the work of Mr. E. P. Warren, President of the Berks, Bucks and Oxon A.A., and Mrs. Warren; to Mr. H. S. Rogers, Chairman of the Oxford Society of Architects; Mr. Rayson; the local societies; and to Mr. Ian MacAlister, the indefatigable Secretary of the R.I.B.A.

THE International Congress on Architectural Education will take place at 9, Conduit-street, from July 28 to August 2. The following programme has been arranged:—

Monday, July 28.—In the evening, at the R.I.B.A., there will be a reception by the President and Council R.I.B.A.

Tuesday, July 29.—In the morning there will be a meeting of the members at the R.I.B.A., when papers on Architectural Education in the Past in America, France, Italy, and England will be read and discussed. In the afternoon the members will assemble at the Architectural Association, 34, Bedford-square, W.C., for a visit to the School of Architecture, and proceed thence on a visit to the Bartlett School of Architecture.

Wednesday, July 30.—In the morning, papers on Architectural Education at the Present Time in America, France, Italy and England will be read and discussed. In the afternoon members will embark on a launch at Lambeth, and proceed to Greenwich.

Thursday, July 31.—In the morning, members will meet at the R.I.B.A., when papers on Architectural Education in the Future in America, France, Italy and England will be read and discussed. In the afternoon a visit will be paid to the British Empire Exhibition at Wembley. In the evening the Congress Banquet will take place at the Hotel Victoria.

Friday, August 1.—Visit to Cambridge.

Saturday, August 2.—The following conducted visits have been arranged: Westminster Abbey, by Professor W. R. Lethaby; St. Paul's Cathedral, by Mr. Mervyn Macartney; the City Churches, by Mr. Arthur Keen and Mr. Arthur Stratton; and the British Museum, by Sir John Burnet.

The attention of members is drawn to the exhibition of students' work which will be held in connection with the Congress. About fifty schools will be represented, and it has been found necessary to use both Grosvenor House, Upper Grosvenor-street, and Devonshire House, Piccadilly, in addition to the Galleries of the R.I.B.A. The exhibition will be of the greatest possible interest to all architects, and will be open daily from July 28 to August 2 inclusive, from 11 a.m. to 9 p.m. Tickets of membership for the Congress, including admission to the exhibition, catalogues, and a copy of the congress book of proceedings may be obtained from the Secretary, Board of Architectural Education, 9, Conduit-street, W.1, price 10s. 6d.

The British School at Rome: The Rome Scholarships.

The following awards are announced:—

Faculty of Engraving.—Mr. W. E. C. Morgan (Slade School) has been awarded the Rome Scholarship in Engraving for 1924.

Faculty of Architecture.—Mr. M. A. Sisson, B.A. (London University), has been awarded the Henry Jarvis Studentship of the Royal Institute of British Architects for 1924. No appointment will be made to the Rome Scholarship in Architecture for 1924.

Sir John Simpson has been re-appointed to represent the R.I.B.A. for a further period of three years on the Council of the British School at Rome.

ARCHITECTS' AND BUILDERS' INQUIRY BUREAU

*** We are glad to give questions and answers but cannot accept responsibility for contributed replies, especially on legal matters.*

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or better still, in typescript?—ED.

Sand-lime Bricks.

SIR,—Would you kindly inform me where I can get some reliable information as to the advantages and disadvantages of the manufacture and use of sand-lime bricks in this country? D. B. H,, *Lt.-Col., R.E.*

Stains on Slates.

[Reply to MR. R. T. BECKETT.]

SIR,—I feel sure that many will not agree with Mr. Beckett's experience as to stains on slating, and I think it is commonly accepted that lead and iron produce more obvious stains than does copper. Iron rusts when the paint has perished, or is improperly applied in the first place, and water carries the rust stain down on to the slating; while lead is of a roughish texture that readily collects soot and dirt from the atmosphere, which is again carried down on to the slates below by the weather.

The extent by which the slating retains these impurities depends upon its surface; and the extent by which such stains when once retained are visible, depends upon the depth of colour of the slate. The smooth dark blue Welsh slate is the least liable upon both counts; while the rough and lighter coloured green Westmorland "Peggie," and similar varieties, are much more liable for the same reasons.

I am inclined to think that in the instances where Mr. Beckett has noticed the stains under copper finials flashed with lead, the trouble springs from the lead flashings and not from the copper, and that his memory has failed him when he states that he has not noticed a like thing under an all-lead finial.

I should have said that there is no cure, but that the prevention lies in the use of copper finials flashed with copper.

Apart from the case of finials, there is no doubt that when a beautiful green or grey slate is used, much unsightly staining can be avoided by designing the roof gutters so as not to discharge directly on to a slated surface.

"M.A."

Insulating.

[Further Reply to "INSULATION."]

SIR,—In my reply recently to the above correspondent, I should have stated that where a cavity wall is used for insulating purposes, the cavity should be sealed and not ventilated as in ordinary cavity work. A ventilated cavity merely brings the temperature of the outer air all the nearer to the inside of the building, and, therefore, defeats its own object. A sealed cavity, on the other hand, forms a stagnant cushion of air that is non-conducting and a very valuable auxiliary to the non-conductive properties of the material of which the inner wall shell should be constructed. Care should be taken that this stagnant air cannot escape into the building and thus vitiate its atmosphere.

"L. X."

Cow Houses.

SIR,—Could any of your correspondents with experience in the matter advise me as to the best arrangement and materials for the floor and drainage of a high-class cow-house?

AGRICULTURAL.

Party Walls.

[Reply to "F. J. B."]

The expression "party-fence-wall" is defined by the London Building Act, 1894, as meaning, a wall used or constructed to be used as a separation of adjoining lands of different owners; and, standing on lands of different owners. Such a wall is, however, exempt from Parts VI and VII of the Act, when not exceeding in height seven feet, as measured from the top of its footings.

Both the London Building Act, 1894, and the Towns Improvement Clauses Act, 1847 (which is incorporated in the Public Health Act, 1875), make provision for taking down, securing, or repairing dangerous walls; but, whereas the former Act provides for the expense to party walls to be borne in various ways, the latter Act does not do so. Under the London Building Act, 1894, the expenses of the work would be divided between the two owners A and B; since any Common law rights they may have are excluded by that Act. If, however, the wall is not within the area covered by that Act, then A and B have common law rights. It may be there is possession in common, and therefore a tenancy in common of the wall (see Jones *v.* Read, Ir. R. 10 C.L. 315). If there is no evidence of ownership, a jury is entitled to find that the wall is owned by the adjoining proprietors as tenants in common. (See Standard Bank of British South America *v.* Stokes, 47 L.J. Ch. 554.) Also common user is prima facie evidence that the wall and the land on which it stands belongs to the owners of those adjoining lands as tenants in common.

In Cubitt *v.* Porter, 2 Man. and Ry. 267, it was held that trespass does not lie by one part-owner or tenant in common of a party-wall against the other, unless there is complete ouster, *i.e.*, dispossession or ejection, or some destruction of the common property; but, where one of two tenants in common of a party-wall does some act which, though not amounting to the total destruction of the wall, yet does partial damage, and so causes disturbance to his co-tenant, such co-tenant, whilst he cannot maintain trespass, shall nevertheless have his action for damages.

It follows that outside the London area, A would (if he can prove the rebuilding of the wall is due to B's tree) have a right of action against B for damages, and that therefore B should bear the expense.

With reference to this query, Mr. Henry Lovegrove has sent us the following note:—

This wall should be properly described as a party *fence* wall, and if "A" can clearly prove that the tree on "B's" side did the damage, there can be no doubt as to "B's" liability. Trees should never be planted near walls. I have known many cases of failure.

England's Ancient Monuments.

The work of the Royal Commission on the Ancient and Historical Monuments and Constructions of England is to be reduced owing mainly to the need for economy. In its seventh interim report, which was issued recently, regret is expressed that, owing to loss of staff and its continued non-replacement owing to Treasury ruling and to the refusal to entertain any immediate prospect of its extension, it has not been possible to go forward with the pre-war intention of the Commission to train and place senior investigators in charge of separate counties or divisions of counties with competent staffs under them to report the results of their inquiries to a central office in London for final editing and publication. The succeeding inventories of the Commission will deal in three volumes with the county of London (including the cities of London and Westminster), and the county of Middlesex.

Downham £900,000 Scheme.

Approval for an expenditure of £900,000 in connection with the building of 2,000 houses on the Downham Estate was asked of the London County Council last Tuesday.

THE BUILDING TRADE

BUILDERS' CONGRESS AT OXFORD

The Southern Counties' Federation of Building Trades Employers held its annual summer meeting recently at Oxford. The earlier sessions of the Congress were private, but a public luncheon took place at which the members of the Oxford Federation acted as hosts. There was a reception on the same evening in the Town Hall.

At the reception, Mr. W. C. Walker, the President, on behalf of the Southern Counties' Federation of Building Trades Employers, presented to Mr. W. E. Collier, of Reading, their late President, an illuminated address.

Mr. W. E. Collier, in acknowledging the certificate, said it was true that the time had been one of stress, and one in which a critical situation was reached. They surmounted that without a conflict, he was glad to say, and he hoped they would surmount the present situation in the industry, which might result in a serious conflict. A conflict would bring bitterness and struggle for a certain period. The loyalty of the employers generally last year enabled them to overcome their difficulties, and he believed if the same atmosphere prevailed now the same would probably occur again.

The President introduced Mr. Matthews, President of the National Federation of Building Trades Employers. He should have been with them earlier in the day, but he was at London with the Minister of Labour.

Mr. Matthews said it was owing to their kindness and consideration that he was President of the National Federation a year before he expected to be, and he wished to express his gratitude. He also expressed regret that he was not able to take part in their summer meeting as fully as he would have liked. That day he, among others, had received a message from Mr. Tom Shaw, the Minister of Labour, asking them to meet him at Bedford Square. They were, he might add, going on just as if everything was normal, in the hope that something might save the situation as last year. The prospects were not so bright, however, now. There was one determining factor which could not be left out of the question. If there was to be withdrawing on one side, there should be a withdrawal on the other side. If Liverpool was allowed to carry on as it was at present, Liverpool would not be alone very long—it would spread to Manchester and throughout the country. He believed it was reckoned that there had been so many breaches in the agreement that it demonstrated that the operatives were in the wrong. He was not going to say that some of the employers were not in the wrong; they were, for they made proposals beyond the agreement. They ought to stick to the agreement.

At the ceremonial luncheon, among the members and guests of the Federation who were present were the Mayor and Mayoress, the Sheriff and Mrs. Brown, Ald. Hutchins, Councillor W. M. Gray, the Chief Constable, the Town Clerk, the City Treasurer, Mr. H. Paintin, Mr. W. C. Walker (President of the Federation), Mr. G. A. Hotter (secretary of the Federation), Mr. H. S. Critchley (secretary of the Oxford Association), Mr. Cowley, Mr. G. Gardner, Mr. T. E. Knowles, Mr. T. Rayson, Mr. C. E. C. Lowry, Mr. E. J. Strange, Mr. Lovell, and Mr. Wallis.

Capt. Bourne, the new City member, said it was a very pleasant duty to propose prosperity to the City of Oxford and to welcome the conference to the city. He did not think they would find any more suitable place for a congress of builders than this city, for he thought that here they would find examples of nearly every style of architecture and type of building known in the country. They were threatened, Capt. Bourne continued, with troubles in the building trade which he sincerely hoped would not come to a head. The housing shortage was the most urgent problem of the day, and there was no doubt that there was a very great deal of work before the country in this direction, and he sincerely hoped that nothing would occur to hinder the supply of houses which the builders had in hand. He hoped that Oxford would continue to grow as a city of fine houses, making a worthy setting for the fine buildings which it was its happiness to contain.

The Mayor, who replied to the toast, drew their attention to two little buildings within a stone's throw of where they sat. They were Bishop King's palace, and No. 3, Brewer-street. No one wished for the prosperity of the city more than he did. They had recently had a little dispute in the City Council about some posters, and some University members had objected to the idea of advertising Oxford. But the posters, after all, were only to draw people's attention to the beauties of the city. He hoped they, as builders, would carry out what they set themselves.

Mr. T. E. Knowles, of whom the chairman spoke as one of the oldest and most respected members of the Oxford Association, proposed "The Southern Counties' Federation of Building Trades Employers."

Mr. C. E. C. Lowry, who replied, said that the Federation had a great deal to be thankful for. But he was afraid—though he hoped not—that they had some trouble pending. They were not out to fight their men in the least, and they only wanted to come to reasonable terms with men with whom they had worked for many years. The whole object of the Federation was to avoid quarrelling, and the one aim of their meetings was to try to come to some amicable arrangement with their men.

Proposing "The Oxford Association," Mr. E. J. Strange said the Southern Counties' Federation was trying to build up a scaffolding which should be of permanent advantage to the building industry.

Mr. W. C. Walker, the President, said builders were trying to benefit the industry to which they belonged. They were endeavouring also loyally to carry out the things their Federation expected them to do. Whether they succeeded or not was not for him to judge, but the members would at least agree with him when he said that Oxford in the past had compared favourably with other towns and districts in that respect.

Municipal Corporations and Housing.

The Earl of Derby was recently re-elected President of the Association of Municipal Corporations at their annual meeting at the Guildhall. His re-appointment was moved by the Lord Mayor.

In presenting the Association's annual report, Lord Derby made reference to the subject of housing. It was, he said, the most difficult problem that they had to deal with, and he wished he could hope that political feeling and bias would be kept out of the consideration of the subject. He did not think there was any great enthusiasm in the Association for the present plan, and the Council was divided on the subject. All that they could lay down, as an Association, was that the question must be and could only be determined by Parliament, and that, so long as no undue burden was imposed on the local authorities, every local authority should do its best to give effect to the wishes of Parliament.

Mr. Trevelyan Thomson, M.P., moved: "That in the opinion of this Association local authorities should have a discretion to increase the maximum superficial area of houses, which will rank for subsidy, by 100 square ft." While it was true, he said, they could build a passable house for the 950 superficial ft. under the subsidy scheme, there were many towns, in the north of England which, if they were to provide decent-sized houses, must have greater freedom and discretion. The motion was carried.

THE BUILDING TRADE DISPUTE.

Our *résumé* of this dispute last week ended with the close of the Court of Inquiry.

After the meeting of the employers' federation at Blackpool the following statement was issued:—

"In regard to the strike in the building trade the employers received with pleasure reports of the loyalty of members in various regions, and desire to emphasise the importance of maintaining their determination to pursue the matter to a definite and honourable conclusion. The meeting approves the action of its representatives at the Court of Inquiry, and agrees to a conference under the presidency of Lord Buckmaster provided that the notices issued nationally for the cessation of work shall be posted on July 12 unless the Court of Inquiry otherwise request."

Mr. W. H. Nicholls paid a high tribute to Lord Buckmaster and his colleagues for their masterly grasp of the points in dispute. Lord Buckmaster had offered to preside over a meeting of both sides, and the employers had accepted. The operatives had promised to consult their executive. As to the merits of the dispute, there might be an impression in the public mind that the dispute might be one of wages or hours only, but the issue was far bigger. It was a fight for a principle and the honouring of an agreement constitutionally made between the organised bodies of the employers and operatives, and of the employers being able to exercise reasonable control in their own businesses.

Following a meeting of the Disputes Committee of the Operatives' Federation, Mr. R. Coppock, the men's secretary, declared that the reports they had received from the country were very satisfactory. He said more men were returning to work because the employers were giving way, and that hundreds of agreements conceding the terms had been signed, and sent to his office for registration.

Concerning the possibility of a Liverpool Conference, he said that the Operatives' Federation had not the slightest objection to the Liverpool operatives meeting the Liverpool employers, but he declared that this would not affect the national position.

In a statement issued subsequently by the employers, however, it is stated that in the Agreement which the men are trying to get individual employers to sign, conceding an advance and a guaranteed week, there is the following clause:

> That this agreement is operative only so long as the general position remains unsettled, and will be subject to the provisions of any larger agreement.

This we take to mean that the men's demands for local and regional settlements are only temporary, and that these are expected to be superseded by a new national agreement. The employers desire that the public should realise that the statement made by the operatives that hundreds of employers have signed agreements on the operatives' terms may convey an entirely false impression, such agreements being in a large number of cases between unfederated employers and individual men only.

Meanwhile Mr. Moss, the secretary to the Liverpool employers, met Mr. Fyles, the leader of the strikers. They discussed, it is stated, the possibility of a resumption of local negotiations. Mr. Moss gave the following account of the interview:—

"In view of the appearance of different statements purporting to be from Mr. Fyles and Mr. Wilson respecting a suggested round-table conference, I had an informal interview with Mr. Fyles to clear the matter up. After a long discussion Mr. Fyles said that his

society would be prepared to discuss the position, but under no circumstances would his society meet the national employers or the national operatives. I urged from every point possible that good might result from the round-table conference, but he would not agree. It is a complete fabrication that I gave any assent to the possibility of a resumption of local negotiations or to a conference between employers and operatives this week-end."

The following statement was issued later by the London Employers' Association:—

Our members are absolutely loyal. Every inquiry has been made into the statement that federated firms have signed the operatives' agreement. There is no basis whatever for such a statement. Members of the London Association complain of trade union organisers visiting various firms and stating that such and such a firm has signed the agreement, but when the matter has been inquired into and demand has been made for production of the signature it has not been forthcoming.

The London master builders are now issuing permits to their own members in exceptional circumstances where work must be carried out in the interests of the public health and safety, and they drew public attention to the action of the operatives in the case of Westminster Hospital, where alterations are nearing completion and where patients have been informed that they would be received on the 17th inst. The men refused to allow the operatives to work on the job until the increased rate was paid.

The lock-out has been further postponed by the building trade employers, as will be gathered from the following announcement:—

The National Allied Building Trades Employers' Disputes Committee met to consider the dimensions of the strike. Reference was made to the statement of Mr. Nicholls at the Court of Inquiry that if a request was received from that quarter to suspend the lock-out notices they would be suspended. Although no such request has been received owing to the delay in issuing the Court's report, it was felt that in view of the fact that the strike is now national in character and extent, the notices should be further suspended pending further instructions, and telegrams were despatched accordingly.

Mr. R. Coppock, secretary of the National Federation of Building Trades Operatives, speaking at a mass meeting of the North Staffordshire branch of the Federation held on Saturday at Trentham Park, North Staffs, made several important announcements.

Among them Mr. Coppock said, with regard to the question of hours, the Federation was going to support the whole of the men in their claim for the maintenance of a forty-two hour week—or less. With regard to a guaranteed week, they could not, and did not, intend to enter into negotiations to consider whether it was right or proper. The building industry could afford to pay guaranteed time, and must. It could do so if it organised in such a manner as to take over the newer methods which were at their disposal.

The employers, in a reply to the speech of Mr. Coppock, state: In many places the building of houses, particularly those for the working classes, is not an economic proposition, as the value of the house when erected is less than the cost in labour and material. The operatives are forcing an upward tendency in the cost of production at a time when the cost of living is tending to fall. Mr. Coppock openly declared that the operatives had, as a result of their organisation, an opportunity of exploiting the situation, and they would use this to the advantage of their members. The public should see, from this evidence, that the future position of building is extremely uncertain, in view of the progressive demands of the operatives; and the employers, in the interest of the public as well as in their own interest, are pressing for a settlement on a national basis that will restore security.

THE WEEK IN PARLIAMENT

WESTMINSTER, *Wednesday.*

Cost of the New Houses.

Mr. Masterman asked the Minister of Health if he would now state the figures proposed by the Building Committee in Cmd. 2104 as *x* and *y* per square ft. at which they were prepared to build two and a half million houses of a limited size during the next fifteen years.

Mr. Wheatley said he thought it would be against the public interest to publish the figures in question. It would be remembered that he had agreed with the local authorities to proceed normally by the method of competitive tenders.

Mr. Masterman: Is it not impossible for us to discuss the question without knowing the offer made between the combinations of building operatives and employers?

Mr. Wheatley: The right hon. gentleman is not justified in describing it as an offer. It was an item of information supplied to the Ministry of Health to enable it to judge whether the best competitive tender was a reasonable one in present circumstances. If I circulate it, the right hon. gentleman will readily understand that it will become a guide to competitors.

The 1923 Act.

Mr. Wheatley informed Captain R. Terrell that applications were still being received for authority to proceed with the erection of houses under the Housing, etc., Act, 1923. Since the beginning of this year authority had been given for the erection of 62,743 houses —20,421 by local authorities and 42,322 by private enterprise.

Size of the New Houses.

Mr. T. Thomson asked the Minister whether he was aware that at the recent annual meeting of the Municipal Corporations Associations, held in the Guildhall under the presidency of Lord Derby, a resolution was passed by 300 representatives of local authorities protesting against the limitation of the maximum measurement for houses proposed in the Government's Housing Bill, and would he reconsider the policy of the Government on this question.

Mr. Wheatley said he had had no intimation of the resolution referred to, but very few local authorities had utilised to the full the powers which they already possessed.

Mr. D. G. Somerville: Is not the fact that the local authorities have not utilised their powers due to there being no men to build them?

The £500 House.

Mr. Wheatley informed Mr. Simon that he did not propose to introduce a Bill under which houses costing £500 each would be let at a rent of 3s. 3d. weekly.

Mr. Simon: Is the right hon. gentleman aware that the statement made by him that a £500 house could be let for 3s. 3d. per week has been broadcast all over the country, and was repeated in an interview given by him to the *New Leader* of last Saturday? If he does not propose to introduce a Bill, I think he owes it to the House to say that he is totally incapable, either under capitalism or under socialism, of doing anything of the kind.

Mr. Wheatley: It is quite true that I stated in the House and in the public press that, but for the interest charged on capital, a £500 house could be let economically at 3s. 3d. a week. I am not prepared to say what I would do in a state of socialism.

Mr. Hannon: How does the right hon. gentleman propose to erect houses in this country without capital?

Mr. Wheatley: I was not proposing to erect them without capital. I was proposing to erect them with bricks, and other materials.

Mr. Simon: How does the right hon. gentleman propose to raise the money for this purpose without paying any interest to the people who lend the money?

Mr. Wheatley: I am not proposing to borrow money free of interest under this Bill, nor, indeed, to borrow money at all. That will be the business of the local authorities.

Wooden Houses.

Mr. Wheatley informed Lieut.-Commander Fletcher that a small number of proposals had been received from local authorities for the erection of houses mainly constructed of wood, or for sanction to grant financial aid to such houses, and in some cases approval had been given. He believed the position as regarded special methods of construction was generally understood by local authorities, but he would note the suggestion of issuing a circular following the passing of the Housing Bill.

Lieut.-Col. Fremantle asked if Mr. Wheatley would make some kind of investigation into the length of life of these wooden houses, in view of the statements that were being made on the subject, and of the quite general feeling of those who, like himself, had had experience of condemning insanitary houses, that their life was not long enough to justify the comparative saving in cost.

Mr. Wheatley said he thought that information might be very valuable, and he would endeavour to obtain it.

Capt. Eden: Is it not a fact that some of these houses have been in good repair for between 80 and 100 years?

Mr. Wheatley: I do not know, but I have known some which were not in good repair after ten years.

The Treaty with the Building Trade.

Mr. E. Simon asked the Minister of Health whether the treaty he had made with the building trade as to the augmentation of labour was embodied in any other documents beyond the Housing (Financial Provisions) Bill; if not, whether the building trade and the several trade unions concerned had explicitly accepted the Bill as constituting a guarantee in return for which they were prepared to undertake that there should be one apprentice to three craftsmen in the various branches of the trade; if so, what period was covered by this undertaking; and would he submit to the House copies of any documents signed on behalf of the building trade or the trade unions in this matter.

Mr. Wheatley said the Report of the National House Building Committee had already been submitted to the House, and there were no further documents signed on behalf of the building industry dealing with the matter referred to.

Mr. Simon asked what guarantee there was, if the House passed the Housing Bill, that the agreement embodied in the measure might not be repudiated by one or more of the trade unions, and that they might not refuse to provide the extra labour and apprentices which was part of the bargain.

Mr. Wheatley: The only guarantee that one honourable body of men gives to another.

Mr. Simon: Is it not the fact that honourable bodies of men can only be bound by some thing to which they have agreed? I want to know whether they have agreed.

Mr. Wheatley: They have agreed to deliver so many houses per annum for a given number of years, on condition that the State and the local authorities order them. They have given that guarantee in the building trade report; no other guarantee is of very much importance.

Replying to further supplementary questions Mr. Wheatley said that the Building Committee's Report contained the guarantee given by the building industry to him. The Housing Bill contained the guarantee given by him the industry.

Bricklayers' Apprentices.

Asked by Mr. D. G. Somerville whether was aware that it would be three to fo years before any apprentice was capable taking his place among tradesmen in t Bricklayers Union, and whether, under circumstances, he considered that the resto

tion of the apprenticeship system in the building industry would be adequate to meet the shortage of labour in carrying out the housing proposals of the Government, Mr. Wheatley said the answer to both questions was "Yes."

Price of Building Materials.

Mr. Wheatley informed Sir K. Wood that there had been considerable fluctuations in the prices of such materials as lead and iron water pipes during the last four years. He was not able to say to what extent these fluctuations had been due to the demand of foreign markets. They had no doubt been due to various circumstances, especially to the fluctuations in prices of raw materials.

Structural Materials.

Mr. Wheatley informed Mr. Foot Mitchell that according to the circular to local authorities issued in connection with the Housing Act, 1923, the materials to be used for the construction of houses must be of good quality such as was ordinarily specified by a local authority in a contract for workmen's houses; and the construction must be of a type for which a period of not less than sixty years would be allowed by the Minister of Health for the repayment of loan. Provision was, however, made for variation by special approval of the Minister. The question would be further considered.

Belgian Bricks.

Mr. Penny asked the Minister whether he was aware that Belgian bricks were being offered alongside wharf in the Thames at 55s. per 1,000 as compared with 85s. and 75s. for Kentish first- and second-class stock bricks in the field; whether he could say how the quality of the Belgian bricks compared with that of British-made bricks; and whether any considerable quantity of the former were being used in the construction of subsidised houses.

Mr. Wheatley said the answer to the first part of the question was "Yes." In answer to the second, he understood that the bricks at present available were not regarded as equal in quality to first- and second-class stock bricks. In answer to the third, he was not aware that the bricks were being used on subsidised houses. If foreign bricks of satisfactory quality were available at lower prices than British bricks he should expect local authorities to avail themselves of them.

Prices per Foot.

Mr. Wheatley informed Lieut.-Col. Horlick that the average prices per superficial ft. of non-parlour houses with three bedrooms included in tenders obtained by local authorities and approved by the Ministry of Health during the month of July in each of the years 1919, 1920, 1922 and 1923 were:—

	s.	d.
1919	16	5¼
1920	20	2¾
1922	9	4
1923	8	7½

The average price per superficial ft. for non-parlour houses in January, 1924, was 9s. 10d., and for May, 1924, 10s. 8d.

Dwelling-Houses or Offices?

Mr. T. Thomson asked the Minister of Health whether, in view of the continued aggravation of the housing shortage by the conversion of existing dwelling-houses into offices, garages, clubs, and other purposes, he would reconsider his refusal to introduce legislation this session, in order that no further diminution of the present number of dwelling-houses should take place, with its consequent suffering and additional overcrowding.

Mr. Wheatley said he would consider whether it would be possible to take steps to deal with the matter referred to, but in view of the state of Parliamentary business he was afraid he could not undertake to introduce legislation for the purpose this session.

Town-Planning Areas.

Mr. Greenwood informed Mr. Ayles that 229 local authorities had passed the necessary resolutions preliminary to making town plans for their areas.

RATES OF WAGES IN THE BUILDING TRADE.

The following are the rates of wages in the building trade in England and Wales. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Bricklayers.	C'p'ters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Labourers.
Aberdare	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Accrington	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Altrincham	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Ashton-under-Lyne	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Barnsley	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Barrow-in-Furness	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½

(For rates of wages in the Building Trade in Scotland, see page 114.

CONTRACTS, COMPETITIONS, &c.

Forsome contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders: and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

BUILDING AND PAINTING.

Forces during the war and have had first-class experience with leading quantity surveyors (London system). Joint Substitution Board (Treasury and Ministry of Labour), Montagu House, Whitehall, S.W.1, giving full particulars and hourly rates required.

The County Hall.

At the L.C.C. on Tuesday, Mr. J. D. Gilbert inquired as to the present position of the County Hall Extension scheme, if the raft foundation had been completed, whether the contract had been let for the new wing, and when it would be completed.

Mr. E. Gray replied that the raft foundation was still in progress, the date for completion being in August. The question of the superstructure had not yet been decided, but was under consideration. It would take two years to complete.

Experimental Houses.

At the L.C.C. on Tuesday, Captain O. Wakeman inquired whether, in view of the desirability of ascertaining more definitely the merits of some of the cheaper methods of house construction which are being advocated, the Housing Committee would be disposed to give facilities for experiments to be tried on some of the Council's housing estates with that object?

Col. Levita, Chairman of the Housing Committee, replied that, with the concurrence of the Ministry of Health, the Committee was prepared to give facilities, subject to necessary safeguards, for a thorough trial of any and every form of construction which responsible persons might propose, and which would be worth a trial on the basis of economy in money, men and materials.

An Outing in Surrey.

The Provincial Committee for this County of the Surveyors' Institution arranged for the usual annual meeting to be held this year at Guildford. The Mayor and Mayoress received the members in the Town Hall on Friday last, and after inspection and description of the ancient building and the paintings a visit was paid to the ancient Grammar School. After luncheon the Mayor called on Mr. Henry Lovegrove to propose the toast of the Surveyors' Institution, to which Mr. Alex. Goddard, O.B.E., the Secretary, responded. Mr. Brown, the Chairman of the Provincial Committee, proposed "The Ladies," to which the Mayoress responded. The party then went in motors to Loosley Hall (a fine Tudor mansion), then to the chapel and pottery works of the late G. F. Watts at Compton.

Kelly's Directories, Ltd.

We have received from Messrs. Kelly's, Ltd. a copy of the thirty-eighth annual edition of their "Directory of the Merchants, Manufacturers and Shippers of the World." Information is given in respect of every civilised country of the world.

The Directory is in two volumes. The first deals with foreign countries, and their dependencies; while the second gives information concerning England, Scotland, Ireland and Wales, and the British Dominions and Possessions. For each of the foreign towns and cities, carefully classified lists are given of those engaged in trade and commerce, with the class of goods in which they deal. In the section devoted to Great Britain and Ireland, classified trade lists are given for (1) London and its suburbs, and (2) for the rest of the country. Exhaustively indexed in four languages, all vital information is instantly accessible to the reader.

It gives a comprehensive list of Builders, Building Manufacturers, &c., in fact, all branches of the trade in all parts of the world, from America to Zürich. It is of equal interest to architects, as it enables them to obtain in the easiest manner full particulars of all trades connected with architectural interests, not only in Great Britain and Ireland, but in the remote places of the world. The latest edition more than ever merits its popular title, "The Key to the World's Commerce." The use of the book is considerably simplified by a concise explanation of its arrangement and by a practical example of how to use it. The Trade Mark and Brands (an interesting feature) are arranged alphabetically under the trade heading of those goods which each manufacturer is best-known as the maker.

Bath Master Builders' Association.

The annual outing of the Bath Master Builders' Association took place recently, when a party of over 70 journeyed by train to Newport from where they proceeded by chars-a-bancs to Abergavenny. The party afterwards proceeded to Tintern, via Usk and the Wye Valley. The Mayor of Bath, Councillor C. H. Hacker, and the City Surveyor, Mr. E. P. Sissons, accompanied the party on the trip.

Master Builders' Federation.

The Master Builders' Federation, at their conference at Blackpool recently, discussed a report of their National House Building Committee, and passed a resolution condemning the financial proposals of the Government with respect to their housing programme.

New London Hospital.

The Chairman of the Royal Ear Hospital, Dean-street, Soho, W., Mr. Geoffrey E. Duveen, recently announced that negotiations had now been completed for the purchase of a site on which to rebuild the Ear Hospital. The site was situated on the corner of Huntley-street and Pancras-street, Bloomsbury, W.C., and had the chief advantage of being adjacent to University College Hospital and the New Rockefeller Buildings. The work of clearing the site and building the new hospital would be put in hand as soon as possible.

PROPOSED NEW BUILDINGS & OTHER WORKS

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations: T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.C. for Board of Guardians; B.C. for Borough Council; P.C. for Parish Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; and B.E. for Board of Education.

Westminster Bank, Ltd.

The Directors of Westminster Bank, Ltd., have declared an interim dividend of 10 per cent. for the half-year ended June 30 on the £20 shares, and the maximum dividend of 6¼ per cent. on the £1 shares for the same period. The dividends, 10s. per share and 1s. 3d. per share, respectively (both less Income Tax), will be payable on August 1.

THE SCOTTISH BUILDE

NEW BUILDINGS IN SCOTLAND

Sauchie.—CHURCH.—The Stirling and Dunblane U.F. Presbytery has approved of plans for a new church. The estimated cost is £8,000.

Coatbridge.—HOUSES.—The Dean of Guild Court has passed plans submitted by the T.C. for the erection of 224 houses at Rosehall, at an estimated cost of £70,000.

Harthill.—HOUSES.—At a meeting of the Middle Ward District Committee of the Lanark C.C. the Housing Committee agreed to borrow £50,000 to meet the cost of the erection of 90 houses at Harthill, under the scheme for the improvement of insanitary areas.

Elgin.—HOUSES.—The Corporation is considering a scheme which has been prepared by the Burgh Surveyor, for the erection of houses, at an estimated cost of £280 each.

Stirling.—SCHOOL.—The Stirlingshire E.C. has decided to erect a school in the Riverside district. The building will provide accommodation for 800 scholars.

Aberdeen.—VARIOUS.—The Board of Health has notified the T.C. of their approval to the amended lay-out of the sixth development of the Torry housing scheme.—The Directors of Aberdeen Royal Infirmary agreed to accept the offer of the Cruikshank Trust to provide the sum of £11,114 6s. 3d., the portion payable by the Infirmary of the price of the site for the new Aberdeen Joint Hospital.

Glasgow.—VARIOUS.—The Dean of Guild Court has passed the following plans: J. Wheatly, M.P., and others, trustees of the Shettleston Branch of the I.L.P., a hall in Darleith-street, Shettleston, at a cost of £1,440; City Bakeries, Ltd., a bakery at 23, Clarendon-street, £24,034; T. Baird, 134, Bath-street, 11 terrace houses at Doune-gardens, Cathcart, £8,613; Scottish Co-operative Wholesale Society Ltd., extension to boot factory at Renfrew-road, Shieldhall, £16,803; Howard & Wyndham, Ltd., alterations to Theatre Royal, Hope-street, £3,000; J. Melrose, 788, London-road, bungalow in Webster-road, Mount Vernon; G. Hoy, grocer, 8, Robertson-street, Partick, shops, Thornwood-avenue, Partick; and cross Miners' Welfare Society, an inst in Dunlop-street, Tollcross, £5,780.

Troon.—HOUSES.—The Dean of Guild has passed the following plans: W. M. Langside, Glasgow, house in Logan-dri an estimated cost of £800; J. Wheelan, ander-street, Airdrie, two houses in Ces road, at an estimated cost of £2,000.—H. Troon, house in Harling-drive, at an esti cost of £1,000; and Miss A. Neilson, St street, Glasgow, house in Harling-drive estimated cost of £1,000.

DUNDEE HOUSING SCHEME

THE Housing Committee of Dundee Council met recently and Mr. John Re convener, made reference to a large sch private enterprise in building that was launched by a new Dundee company. company has already obtained land, pr lay-out plans, drawn up type plans and cations, and if the Government's new Bi tained a clause authorising the Corpora give a subsidy to private builders, the company was to launch a huge scheme o building. The houses were proposed built in blocks of from three to eleven hous the total number of houses on four selecte was 1,166. The suggested rent of the was £28 per annum, and it was also prop build a number of five-roomed houses to at £34. The total number of houses to b was 5,000. He added that the Corp must see that the type of houses to be built be such as would raise the standard of in Dundee, and that they would not me a makeshift—a scheme having for its p purpose the creating of huge dividends pany promoters or their shareholders.

Mr. W. H. Buist calculated that th subsidy from both the Government and t authority to this scheme would amount t £400,000 in 20 years.

New Park for Edinburgh.

Hillend Park, presented to the city o burgh by Mr. John White, builder, Co drive, Edinburgh, was opened recently b Provost Sir William L. Sleigh in presen large company, who were present on the tion of the Public Parks Committee of th burgh Town Council. The new park, w a strip of Pentland Hills land, has north side Lothianburn Golf Course rises in a north-westerly direction; views from the higher parts of the hill are the most magnificent that can be obtain any part of the Pentlands to which th have access. The Lord Provost, in d the park open, thanked Mr. John White park which he had gifted to the city.

Obituary.

Mr. William G. Rowan, the Glasgow a whose death occurred recently, speci the erection of ecclesiastical buildings, left many examples of his skill in His earlier work included Pollokshie Church, St. John's Wesleyan, Wy Church, Crown-street; and Strathbung Church.

New Method of Bricklaying.

In the House of Commons a f since, the Minister of Health w if his attention had been calle new method of building, which was n demonstrated at Tonbridge, under was claimed that an unskilled man 3,000 bricks a day.

Mr. Wheatley said he was awar new method of laying bricks in co struction, in regard to which he ha quiries made, was being tried at T but the work was not sufficiently ad enable any opinion to be expressed

BUILDING TRADE WAGES IN SCOTLAND.*

THE following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Brick layers.	Carpenters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Brick-layers' Labourers.	Masons' Plasterers' Labourers.
Aberdeen	1/7½	1/8½	1/7½	1/8	1/7½	1/7½	1/4½	1/0½	
Airdrie	1/7½	1/7½	1/7½	1/8	1/7	1/7	1/6½	1/2½

THE BUILDER

A JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

CXXVII.—No. 4251. JULY 25, 1924.

MR. WHEATLEY'S HOUSES

THOSE who read the debate in the House of Commons on the Housing Bill on July 16 must have been struck by the new spirit shown. It would not be exaggerating to say that this debate was epoch-making. Colonel Fremantle moved an amendment roviding that no proposal for the provision of twenty-five r more houses should be sanctioned until the Minister was tisfied that it would not be prejudicial to any town-planning heme, his object being to "prevent a housing scheme from eing a blot on the country-side or tending to the future creation slums." Mr. Wheatley, although for technical reasons unable accept the amendment, undertook to draw the attention of cal authorities to the tremendous importance of the object nderlying this amendment, and to the need, in the re-building a large part of the country, of particular care in order to see at the lay-out would be creditable to the country. Colonel remantle withdrew his amendment on the understanding that definite provision dealing with the subject he had raised would inserted on the Report stage of the Bill. In reply to another ggestion concerning the purchase of houses by local authorities, r. Wheatley stated his objection that this might lead to the trusion into local schemes of houses that would injure the cality, but that, since his object was to get houses, he would consider the matter and try to bring in a satisfactory form words which would protect the locality. In the same debate, r. Brown, supported by Viscount Wolmer, moved an amend-ent providing that in an agricultural parish not more than ght houses should be built to the acre. Mr. Wheatley, in ply, expressed his willingness to accept the amendment in bstance, and also to limit the number of houses to be erected an urban district so that they should not exceed twelve to e acre without the consent of the Ministry.

The importance we attach to this debate will probably pear extraordinary to the next generation, "For," they ll say, "surely these precautions are natural enough, and any nsible man would adopt them." That any Housing Act ould be passed without providing for amenity and density, ll be as unthinkable to them as it is to us that women should til recently have been regarded as their husbands' chattels, that little boys should have been forced up suffocating imneys. While Dr. Addison was the political pioneer in proved housing, yet we must remember that he was in office ring a period of enthusiasm; whereas Mr. Wheatley finds mself in an atmosphere of disillusionment. We take no litical side and sincerely hope that all parties will co-operate so far as the maintenance of the improved standard of housing concerned. If we say that we cannot afford it, we place our-lves in the position of the man who says he cannot afford to nd his children to the dentist, and we invite all the responsi-lity for disaster that such culpable negligence entails. The ct that both Colonel Fremantle and Viscount Wolmer are nservatives is of happy augury, and will, we hope, help to t this national question out of the rut of party politics.

At the same time, while we are all desirous of providing r amenity and reducing the number of houses built to the re, we must not shut our eyes to the facts, and we know drastic limitation of houses to the acre in some districts is t of the question as things are. The discussion at the Liver-ol Congress of the Royal Sanitary Institute affords some indication of the opinion of competent officials who are practically interested in the question, and we may quote the remarks of Mr. J. A. Brodie, City Engineer of Liverpool, who said: "In parts of Liverpool, near the Mersey, with plenty of open space, as many as fifty dwellings had been built to the acre, and there was not a more healthy and sanitary area in the city. In large cities the cost of land was so high that the limitation of twelve houses to the acre was quite impossible. Also, it had to be remembered that everybody who was used to city life did not want a garden, and many of them did not know what to do with them when they got them."

If Mr. Wheatley carries his points where possible he will have taken a step forward which no future Government will dare to retrace. The numerous societies that have been formed to protect the community, and organised public opinion generally, will be too strong to be flouted, and we sincerely hope private enterprise will take its stand on the side of progress which alone can enable it to make good. We well know there is an improvement—a great improvement—but no one can travel the country without realising that there is still a sufficient percentage of bad work to nullify the effect of the good new houses. Some localities are still entirely bad, others, to their credit, are altogether good, but the majority are a jumble of good and shoddy. We know of one estate belonging to a local authority which has been developed and laid out on excellent lines; some two dozen perfectly simple and nice houses were built, and then one of the plots was sold to a man who erected a hideous bungalow that could only be appropriate among its fellows at Jazzing-on-Sea. Local authorities ought to exercise control over their estates, and when they sell plots they should reserve the right to approve plans and elevations of the proposed houses and submit them for approval to somebody who knows his job.

The school children are the citizens of the future, and they ought to be educated in the way best calculated to make them efficient. We suggest that some of the time they now spend in learning irregular verbs, historical dates, and the names of promontories might well be devoted to learning the elementary principles of architecture. As a lesson it would, if well taught be extremely popular; it could, in many districts, be illustrated by visits to good local buildings, while *mauvais examples* would always be available for instruction and amusement.

To return from the Board of Education to the Ministry of Health and its problem. The house builder, very naturally, objects to being called a "Jerry-builder"; he associates jerry-building with flimsy construction and scamped work, but he does not often realise that the term is used even more to denote a certain pattern of design; and while he continues to build on Peckham lines—no matter if his walls are 20 in. granite (of course, roughcast and "Tudored" outside), he will continue to earn the name "jerry-builder," even though his friends may be too polite to call him by that name. The construction is not visible from the outside, it is the design that is seen by the passer-by. An opportunity is open to the National Federation of House Builders to institute among its members a serious course of study in house design, to examine Georgian work, and so to get to know why his designs as designs have made him less effective than he might be in his present appeal for reinstatement.

NOTES

Sir Giles Gilbert Scott, R.A.

The whole profession will join with us in appreciation of the honour of knighthood bestowed on the architect of the Liverpool Cathedral at the consecration services held during the visit of the King and Queen on Saturday. Sir Giles Gilbert Scott, R.A., has achieved much more than titular honour by the exercise of his fine and exceptional instinct for the development of Gothic art. The record of his work at Liverpool shows the inspiration of progressive thought, so that we may look forward with pleasurable hopes to the possible completion of his great work. The qualities which his design shows are those which the student of architecture needs to apprehend whatever be his predilections for style or method. It has been stated that he is more of a Classicist than a Gothicist, but his understanding of architectural values enables him to see where and how the dominance of the horizontal or the vertical may be rightly pronounced and to what extent the linear or plastic qualities may be emphasised in architectural design. After all, the definitions of art are very illusive, and cannot be reduced to rules and diagrams.

Parents and the Educational Conference.

A parent contributes a useful article on p. 123, which has been suggested by the Educational Conference which is being held next week in the rooms of the Royal Institute of British Architects. That parents have their privileges we are aware, and of their duties we are reminded when we are called upon to sign cheques for the education of our children, but our rights under our educational system are not so obvious. We wonder whether those responsible realise, as our contributor remarks, "the sweat and tears a sustained course at the schools means to many homes," and the importance therefore of co-operation between staff and homes: "While an easy sympathy may often exist between master and pupil, unless the former has made himself familiar with the pupil's circumstances, environment and health, he is hopelessly handicapped. He must co-operate with the parent, and induce the parent to co-operate with him."

Wooden Houses.

The discussion in the House of Commons on the subject of wooden houses, and also the correspondence in the Press on the subject, raises an issue which is in no way easily settled one way or another, and we are glad to see that an inquiry into the number of wooden houses and the desirability of building in wood, together with a general consideration as to their stability and liability to fire, is being considered. Without going beyond the boundaries of Essex or Kent, we are supplied with the evidence that numbers of such houses still exist in country districts, some of them dating from more than a century ago. It would be interesting to know whether statistics can show any greater liability of wooden buildings to fire than those of brick or stone. feel doubtful whether the proportion loss by fire can be shown to be m greater. Their term of life is proba shorter, and in the case of neglect to re and paint would be still more so, but can call to mind many cottages and sm houses, not to say mills, built in this w which charm us still by their agreea construction and attractive appearan They date mostly from a time sufficien long ago to include real taste in th appearance and planning, and we sho have thought at such a time it was clea desirable to encourage building in t material. With red tiles—pantiles preference—and their weather-board surfaces painted black or white, they fo an adornment to the countryside. T boarding needs to be well capped, and m of us are familiar with the traditio moulded edge which gives so attract a character to the weather-boarded ho of a hundred or more years ago.

Crockery Smashing.

What a gloomy nation should be if we had no se of humour! Mr. Pu often comes to the rese and we are grateful to him for illustrat recently his views on the build industry. Mr. Wheatley, with the ai a magic lantern, is demonstrating " perfect and almost automatic co-ordi tion between all branches of the build industry in pursuance of my great hous scheme." Unfortunately, through s error on the part of the operator, we shown a scene of the wildest pan monium. We all love smashing crock and if we cannot indulge at home " break up the happy home " at Wemb Failing this we enjoy even looking pictures of turmoil. Let us hope t this particular picture may serve to rem all connected with building of how exp sive it is to carry out our crock smashing at home.

An Ex-Minister's Views.

Sir Arthur Griffi Boscawen, writing housing in *The Times* July 16, asks for furt light on certain questions, the first be "How can private enterprise, as we k it before the war, be brought back i the business?" We suggest that answer to this is only of academic inter because few who have studied the sub want to get private enterprise back, *as knew it before the war*, although many us would like to get it back on impro lines and under adequate control. Arthur speaks with satisfaction of means taken during the past centur prevent the erection of "slums in sense I have described," but he does explain why he is prepared and anx to see us embark again upon the erec of houses which, if not slums to the b are certainly slums to the mind. To in an ugly and depressing neighbourh is as demoralising to the spirit as ins tary surroundings are to the body. politicians seldom understand this.

Photo: H. F. Traylen, F.R.I.B.A.

Burford Church Porch.

The 'Bus Ticket Nuisance.

We recently quoted some excellent advice from *The Children's Newspaper*. From the same source we extract idea that if the omnibus companies uld fix a box for disused tickets at the r of every 'bus it would save the eets from the litter of hundreds of usands of these tickets every day. r habit of throwing old tickets into the eet is untidy and slovenly and could ily be avoided in the way suggested. e same issue contains an appreciation Sir Gilbert Scott in connection with erpool Cathedral. It is a pity that grown-ups' newspapers do not give more art and science and less crime and sation. Are grown-ups really as far ind children as a study of the Press uld imply ?

The Dispute in the Building Industry.

Although the report of the Court of Inquiry into the Building Trade Dispute, which we summarise on p. 142, has been before the ployers and operatives for some days, movement appears to have been de to bring the parties together. e Ministry of Labour has invited the ties to meet early next week to see if re is a basis on which negotiations can resumed. We give on p. 139 some lections on the dispute by Mr. W. H. ocker, K.C., in the course of which the ggestion is made that the Industrial uncil for the Building Industry, or the ilding Trades Parliament as it was led, which was formed shortly after the r, but from which the employers subquently withdrew, should be set up in. One of the principal objects of this ncil, consisting of an equal number employers and operatives, was to ate goodwill in the industry and vent misunderstanding, and had it been in existence to-day we might very well have been spared the present unfortunate dispute.

Values in Stained Glass.

The mystery of reputation and how it is often seen to attach to what is so little worthy of it may be studied with some completeness if we compare the examples of ancient stained glass—some very beautiful indeed—to be seen in the churches of Paris. In popular estimation the glass in the Sainte Chapelle is the most famous, and the only way to account for the almost superstitious value attaching to it is to suppose that it came down from a time before Viollet-le-Duc perpetrated his destructive restorations. There may, before that time, have been some justification both on account of its ancient and artistic character, for the veneration in which it was held. For really the glass has now no claim to any such commendation, and much of it, if judged intrinsically, is very poor indeed. In its early original state, though primitive in character, it no doubt had the qualities which attached to the glass of that period, though we think these qualities much exaggerated, much of the design and colour of that time being very poor. Since the restorations carried out by Viollet-le-Duc, the colour on the whole is anything but good, and the lack of freedom and variety of design, the all-overishness, and want of contrast emphasises the tiresome reiteration of the conventional pattern and hot kaleidoscopic colour.

The Glass of St. Germains.

How many who would think it impossible to visit Paris without seeing this glass would feel the same in the case of the far more beautiful and adequate treatment of the glass of St. Germain, opposite the Louvre, in which glass treatment is not only seen at its best—we speak of the clerestory windows—but in which the architectural relation is so well maintained. Such restoration as this glass has received appears to have been limited chiefly to the repair of breaks and the original character is almost entirely preserved. It seems a great pity that popular judgment should be directed in such a way that its values are of so little account, and warns us of the danger of reputation bestowed so arbitrarily. In the Sainte Chapelle, the decorations by Viollet-le-Duc are of such a character as to challenge the apparitions of nightmare, and put on record the falsity of the pedant and archæologist being in any way identified with the artist.

The late Albert Bruce-Joy, R.H.A.

We regret to announce the death of Mr. Albert Bruce-Joy, R.H.A., the distinguished sculptor, which took place after a long illness at Hindhead, on Tuesday, at the age of 82. The deceased, during his long and interesting career, carried out many important commissions, particularly portrait statues and busts, and his work was always conscientious and dignified. In our next issue we hope to give an account of his career, with illustrations of some of his best work.

High Labour Cost.

The great increase in the proportional cost of labour on building works is pointed out in a pamphlet on the housing question by Mr. W. Woodward, whose very long experience in building affairs causes him to look with great misgiving upon the way we appear to be drifting into a thoroughly bad and uneconomic policy. Much of what Mr. Woodward says is very pertinent to the present issue.

Panel to Front of Back Row of Choir Stalls. Carved by Mr. H. G. Ratcliff to the Architect's Design.

Liverpool Cathedral. Sir G. Gilbert Scott, R.A., Architect.

GENERAL NEWS

Professional Announcements.

The honour of Knighthood has been bestowed upon Mr. John Sulman, F.R.I.B.A., of Sydney, Australia. The recommendation was made by the Commonwealth Government of Australia, in consideration of the valuable work carried out by Sir John for that Government in connection with the new Federal Capital of Australia.

Mr. Frank Lishman, F.R.I.B.A., who has recently retired from the post of Consulting Architect to the Government of the United Provinces, India, which he has held since 1912, has now resumed practice at 8, Gray's Inn-square, W.C.1.

R.I.B.A. Examinations.

R.I.B.A. Final Examination.—It was decided that in the case of fourth and fifth year students of schools of architecture exempted from the R.I.B.A. final examination, six months spent on building works and/or in a builder's office (approved by the school), and otherwise gaining knowledge of the practical side of building, should be recognised as equivalent to six out of the twelve months now required to be spent in an architect's office.

R.I.B.A. Examinations, May and June.—The questions set at the intermediate and final (or special) examinations held in December, 1923, have been published and are on sale at the Royal Institute, price 1s. 6d. (exclusive of postage).

New Thames-side Wharf.

The engineer for the reconstruction in reinforced concrete of the existing timber wharf at Purfleet for Messrs. Harrisons (London), Ltd., is Mr. R. N. Stroyer, M.Inst.Mech.E., specialist in reinforced concrete, of 4, Westminster Palace Gardens, S.W.1. The new wharf, it is stated, will be one of the most important on the Thames, being about 1,000 ft. long, with a depth of water of about 40 ft., while the distance from the coping to firm bottom is about 60 ft.

Northampton Polytechnic Institute.

The vacant Principalship of the Northampton Polytechnic Institute, Clerkenwell, caused by the death of Dr. R. Mullineux Walmsley, in June, has been filled by the appointment of Mr. S. C. Laws, M.A. (Cantab.), M.Sc. (Lond.), Principal of the Wigan Mining and Technical College for the past nine years. The appointment is subject to the approval of the London County Council.

Birmingham General Hospital.

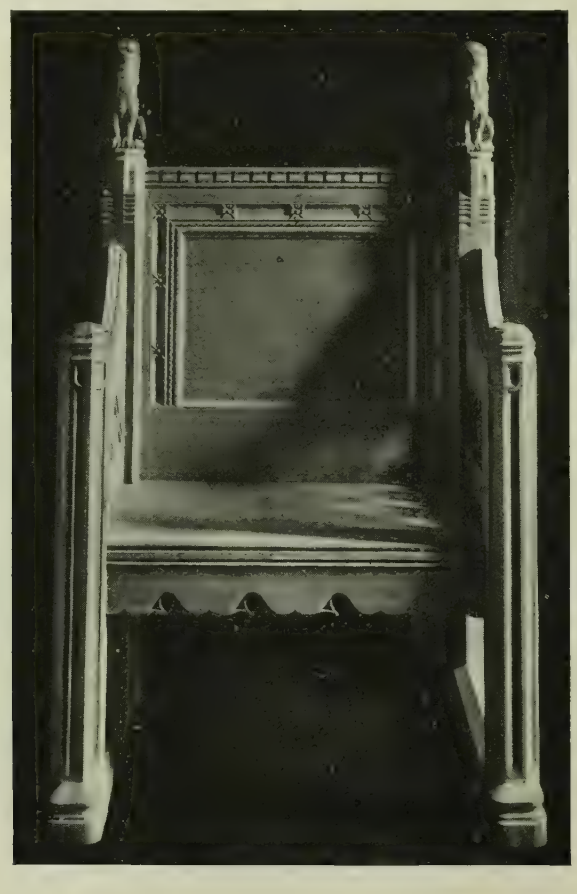
The Governors of the General Hospital, Birmingham, have prepared a scheme for the extension of the hospital, providing for a reorganisation and enlargement of the casualty and out-patients' departments, together with an addition of 130 beds, bringing up the total accommodation to 500 beds.

New Northampton Hospital.

The Governors of St. Andrew's Hospital, Northampton, are embarking on a new scheme for the treatment of patients in the early stages of mental trouble. An entirely separate hospital is to be built in the grounds, this being self-contained even to the staff. The contract has been entrusted to Messrs. J. Martin, Ltd., Northampton, the contract price being approximately £50,000. The architect is Mr. S. F Harris, F.R.I.B.A., Northampton.

Indian Tenders.

Among recent Indian tenders are: The Deputy Chief Engineer, King George's Dock, Port of Calcutta.—5,000 tons Portland cement.



The Executive Engineer, Public Works Department, Delhi.—Wood panelling for Legislative Buildings, Delhi.

The Executive Engineer, Sanitary Works Division, Patna. — Sanitary installation in Hospital, Mental Central Asylum, Kankee, estimate Rs.17,850.

The Chief Controller of Stores, Indian Stores Department, Delhi. — Sukkur Barrage Project.—Workshop machine tools and plant, new or second-hand, and railway weighbridge, 35 tons. 750 tons cement, accompanied by copies of test certificate. Pile-driving plant, either steam-operated or compressed air driven.

COMPETITION NEW

Public Baths, Newton-in-Makerfield.

The Council has appointed Mr. Arno Thornely, F.R.I.B.A., assessor in this co petition. Applications not later than July 2 Sending-in day, September 30. Conditio can be seen at this office.

Aldershot War Memorial.

The conditions of this competition are n in accordance with the Regulations of t R.I.B.A., and Members are advised to take part in it.

Netherlands.

H.M. Consul-General at Rotterdam inform the Department of Overseas Trade that t Municipality of Rotterdam have announce their intention to hold an internation competition for plans for the reconstruction the Koninginne Bridge.

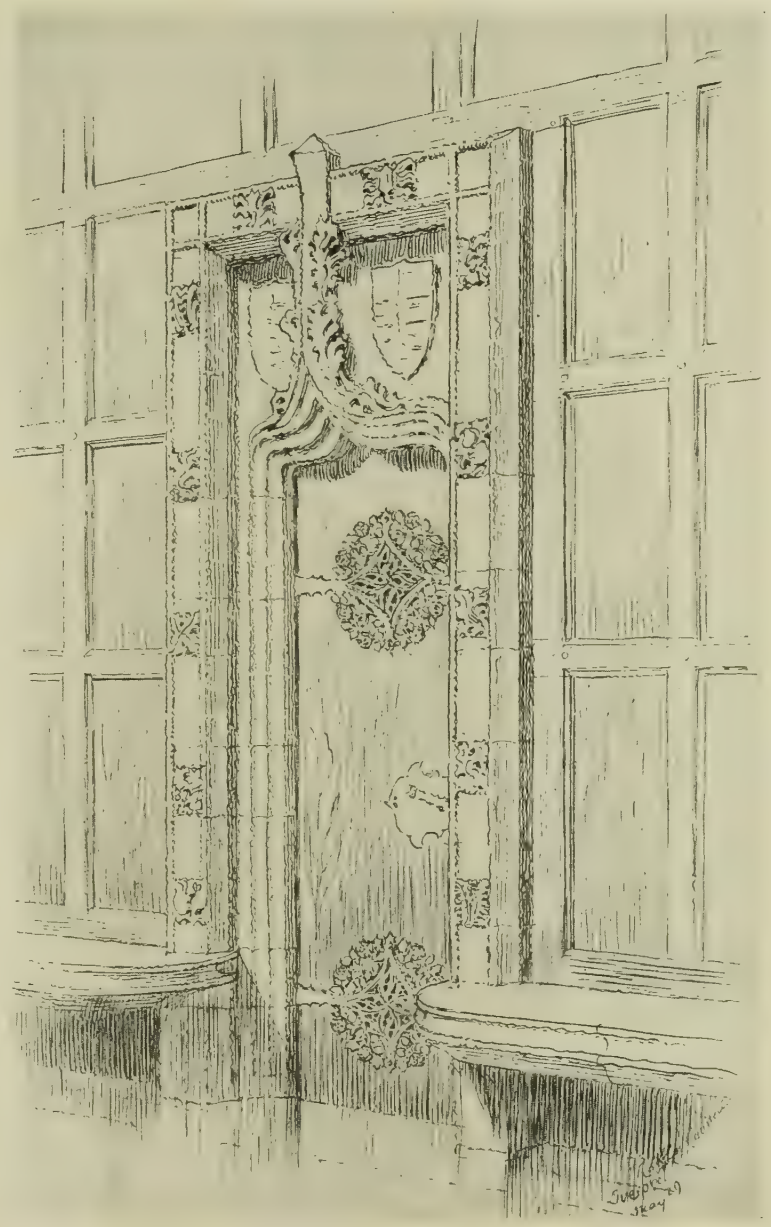
The first prize is 10,000 guilders. Furth particulars from the Department of Overse Trade, 35, Old Queen-street, London, S.W (Reference A.X.1169).

Other Competitions.

Other competitions still open include t following (the dates given are, first the sendi in date, and second the issue of *The Builder* which full particulars were given):—Ross-Smi Memorial (Sept. 30; Feb. 21). Harrogate I firmary (Sept. 30; May 30). Hamilton W Memorial (Sept. 1; May 30). Glasgow Hi School Memorial (Sept. 30; June 13). Mason Memorial (Aug. 22; June 13). Bexhill Ente tainment Hall—Banned by R.I.B.A. (Sept. May 30).

PARENTS AND THE EDUCATIONAL CONFERENCE

By A PARENT



It is natural that the coming Conference on Architectural Education should be highly specialised. Those directly responsible for the training at the schools will have the opportunity to exchange experiences and, which is even more important, to discuss the influence of present methods with practising architects in touch with the young men and women leaving the schools, on whom their first employment largely depends. So far, good. All education is a partnership of which the components—student, teacher, and future employer—are generously recognised, but the remaining co-partner, the parent, is usually regarded as a necessary nonentity who signs cheques. The present writer, therefore, will boldly represent the parent as plaintiff and begin an action for professorial neglect. The defence will plead justification.

Looking back at the last century of boys' education, we can see how deeply rooted is the divorce between home and school in England. It has been a respectable tradition for parents to give up the responsibility of their sons to the schools or universities and, until the last two generations, to keep their daughters at home. This tradition has begun to yield with younger boys at preparatory schools, but as against any privileges that parents have gained there we have certainly lost any vestige of influence over our daughters' education, and we now find ourselves not only confronted with an assured, unconscious, masters' position, but also with most conscious entrenchment of mistresses. From the day that our children leave the friendly atmosphere of a preparatory school until, as men or women, they are finally through their technical education, we as parents are nothing but benevolent and paying neutrals. Possibly, like "subject peoples," parents are not yet ready for responsibility, but the professorial barriers, gracious and impenetrable, are not encouraging: one has sympathy with the lady who declared that she detested going to dinner with a schoolmaster because if he asked her he treated her like a sixth form boy, and if he didn't like her, a fourth.

Let us at once frankly acknowledge the amazing improvement in the educational methods of this generation; the growth of right individualism and character, and above all the delightful relationship between staff and pupil, are a revolution, but until the parent is also taken into full co-operation an essential element is left out, and the pupil is preserved in a protected world remote from everyday life and home. This atmosphere of sheltered grace in elementary education has its reaction on the technical training which follows. If architecture is chosen the prospect is five years at the schools and, while one does not dispute the importance of a sustained course, one wonders whether those responsible realise the sweat and tears it means to many homes. Added to the burden is the anxiety that the student may not prove suitable or may fail to get work when qualified. It is impossible to exaggerate the importance of co-operation between staff and home when doubt arises, or of the insight and decision required before advice can be given. While an easy sympathy may often exist between master and pupil, unless the former has made himself familiar with the pupil's circumstances, environment, and health he is helplessly handicapped. He must co-operate with the parent, and induce the parent to co-operate with him.

A further difficulty arises from the length of the technical training required if a boy wishes later to take a degree at Oxford or Cambridge (or in Ireland at Trinity College, Dublin). We must all admit that it is a good thing for the profession generally to have its percentage of graduates from the old universities, but at the present time of financial stress few men (or their parents) are sufficiently independent to afford the additional three or four years. Neither university gives an architectural degree, and the certificate at Cambridge only shortens the school course by about a year. Only those acquainted with the difficulties can realise how many and how complicated they are, and most people are agreed that it would be disastrous to embark on any scheme that would prejudice the prosperity of the existing architectural schools. Against this we may plead that neither the medical nor the musical schools seem to be injured by the degrees given at Oxford and Cambridge, and it remains a perpetual annoyance to parents that these universities cannot devise a plan with the architectural schools that will benefit both. The title Bachelor of Arts persists as a misnomer when the faculty excludes every branch of æsthetics. It appears ludicrous that among the list of professors we find the professors of Papyrology, Chinese, Animal Pathology, and Sanskrit, but look in vain for Architecture. The universities vaguely imply that they would be prepared to adopt a chair if anyone would endow it, while the architectural schools—perhaps with reason—maintain a lukewarm suspicion. Meanwhile, both are the losers. Nothing can benefit architecture more than the contribution of different experience, and certainly nothing could more enrich the culture of the two great universities than the study of the art to which they owe so much. Architecture depends for its life on cultivated opinion; it has withered because it has been segregated as a technical or archæological side issue. A school of architecture at Oxford or Cambridge in which a degree could be won would revivify its bones, and exercise an immense influence on educated opinion. The degree certainly should not be a diploma for practice, any more than is a medical degree, but its possessor should be eligible to enter the third year at an architectural school. Many men who are doubtful of their suitability to be practising architects would be glad to make this experiment in study. They would take their degree and be that much the richer, without feeling that the years had been wasted. The opportunity would also serve the double purpose of filter for the unsuitable and as a possible recruiting ground for those with special talent.

Once again I accept the statement that there are many difficulties, but most parents believe that if the architectural schools really desired it they could enlist the necessary enthusiasm to get the "chairs" and to make the liaison effective.

Doorway in Chapter House.

Liverpool Cathedral: Sir G. Gilbert Scott, R.A., Architect.

CORRESPONDENCE

Sir Charles Barry, R.A.

SIR,—I also have seen the drawings of the Houses of Parliament at the R.I.B.A. Their late date is obvious. They even appeared to me to be a set of the ventilation scheme as carried out. Possibly it makes no difference to your correspondent that, whereas Pugin died in 1852, Sir C. Barry lived to 1860. I imagine that Pugin did very little in 1851, except in connection with the Mediæval Court of the Great Exhibition —the place where Sir G. Scott records that he last saw him.

Your correspondent might look at Sir C. Barry's sketches for the improvement of Whitehall and completion of the Houses of Parliament (1859); reproduction in the cover of Bishop Barry's Memoirs.

In the course of years I have seen a good few of Barry's drawings and my conclusion is quite different. It has always struck me as a singular thing that Sir C. Barry's powers as a draughtsman are so little realised by architects in general. The "*discerning and sympathetic soul*" will continue to find in the interior of St. Augustine's, Ramsgate, too little visited, I fear, the best work of Pugin.

The whole controversy regarding the Houses of Parliament has always seemed both mischievous and misleading, but the matter is becoming better understood now than was perhaps possible in the heat of the Gothic revival.

There is nothing fresh to be said about it, and if there was the subject can only be approached on the usual lines of historical inquiry, with a due regard to evidence and dates. The late E. Ingress Bell once remarked to me that he could not follow what it was the Puginists proposed to prove. He saw quite clearly that the point of view had been shifted in the course of the old controversy. Does your correspondent realise that Godwin (Editor of *The Builder*) claimed from personal knowledge to be able to decide the matter himself, knowing the men and being about the work all the time?

ARTHUR T. BOLTON.

Liverpool Cathedral.

CARVED ANGEL TO FOURTH ORGAN CASE.

"Barry or Pugin."

SIR,—Early in the 'seventies, when it fell to my lot to become an architectural journalist, I took exactly the same view as that which my contemporary, Mr. C. F. A. Voysey, still maintains and has so emphatically put on record in last week's *Builder* for the information of posterity. Remembering my youthful enthusiasm for Pugin, I recognise with no small sympathy Mr. Voysey's feelings, but think he fails to do Barry justice. When the "Life of Sir Charles Barry" was published by his son, the Bishop, who was then Canon Barry, about the date above referred to, it became my business on behalf of the professional press to ascertain as far as might be what those friends and associates of Welby Pugin who were still living had to say of their own knowledge as to this same personal question. Among those whom I thus interviewed I remember Talbot Bury (whose own work first directed my attention to architecture) and Benjamin Ferrey.

The outcome of my inquiry was that Charles Barry was entirely the author of the lay-out and palatial character of the adopted scheme of the Houses of Parliament (which, as anyone can see, is distinctly Classic in idea), and that Welby Pugin graced the buildings, thus balanced and grouped together, with their final architectural detail. Rightly judged, Barry and Pugin ought to rank as joint architects. Mr. Voysey, however, seems to forget that Pugin submitted on his own a very different design for the Palace at Westminster, and I fancy he has overlooked St. Peter's Church, Brighton—an excellent example of Barry's own Gothic work unaided by Pugin. I dare say Pugin's hand may be discovered in Barry's work at Birmingham. I write away from home, and have not my note books with me.

MAURICE B. ADAMS.

Architectural Education.

SIR,—As a preliminary to the consideration of the above subject by the forthcoming International Congress a few words on the functions of the architect may not be amiss. If they can be definitely settled the educational legislators will know what to prepare him for.

What should the architect undertake? Formerly, erections of every kind came within the province of the architect; now, most large works of a public character—particularly where heavy construction is involved—have passed to the domain of the civil engineer, and at times are sadly and quite unnecessarily lacking in architectural character. Why has this happened?

After the Gothic revival had destroyed the Georgian tradition the architect, looking backward instead of forward, gave a disproportionate amount of time and attention to the study of archæology; also, in many cases, to the accessory arts. Being fully occupied with these matters, he was unable to keep up with the great advances that were being made in scientific construction, and consequently lost a great deal of work; it was undertaken by the civil engineer and executed in a purely utilitarian manner, sometimes to the disfigurement of both town and country.

It will be granted that architectural character of a satisfactory nature should be given to all erections, great or small. To obtain this it is suggested that the architect should be placed in his proper position of general director. He should be the Prime Minister of Building. He should plan and design the general scheme as a

An Oxfordshire Sketch.

grand whole, concentrating his strength on tha and have the details worked out by experts in t various branches working under his gener directions, like so many departmental Minister

Experience (little appreciated now), ri judgment, wide and clear vision, with a we developed sense of proportion, would be nece sary to enable him to see all round and grasp t salient points of a complicated problem a devise a solution that shall satisfy the sometim conflicting claims of convenience, constructi and art. A strong personality would be desi able and enable him to impress his fello workers and inspire them to labour for the lo of their art, also to enable him to hold his ow with boards and bureaucrats, combined wi diplomatic power for easing the difficulties th may hinder the execution of his well-consider schemes.

This is suggested as the ideal that should kept in view in training the architect. T "Mistress Art" requires master minds. Ma of course, would not reach the ideal; the should undertake small works that do n require such high qualifications.

W. J. H. LEVERTON.

Top and Side-light Picture Galleries.

SIR,—I am unable to trace the correspondenc referred to in Mr. Sington's letter in your la number, but I imagine that he has in mind t editorial note in your number dated 4th ins in which you drew attention to the merits of M Seager's "top-side lighting," where the fulle benefits are desired for the display of pictures a two-storied building.

Had you stated, as Mr. Sington suggests, th "the number of top-lighted galleries on a giv area can be doubled by making the ground flo rooms now lighted by windows also top lighted you would have admitted an absurdity. Th a certain portion of ground floor space can planned as top-side lighted galleries is a fa that Mr. Seager has clearly shown.

Mr. Sington has apparently not heard eitl of this well-known authority nor of the essent difference between top-lighting and top-si lighting, which is surprising considering t interest he appears to take in the subject picture galleries.

Mr. Seager's "New Zealand idea" is n generally recognised as the most satisfacto solution of a difficult problem.

G. M. A

The A.A. Excursion.

This year the annual excursion of the Ar tectural Association will be to Spain, the t lasting from September 11 to 26. Furt particulars may be obtained from the Secret 35, Bedford-square, W.C.1.

ARCHITECTURE AT THE PARIS SALON

We must admit that in the Salon—or, more correctly, the two exhibitions of the *Société des Artistes Francais* and the *Société Nationale des Beaux Arts*, which were this year combined—no one exhibition of devastating size—the architectural exhibits were below the average of interest and in general attractiveness. We have no doubt that the works selected were the best of their respective kinds," as we had the good fortune (or otherwise) to see some of those rejected during a visit to the Grand Palais early in the year.

The chief fault would seem to be a lack of imagination; many of the *projets* are sound examples of the traditional style of the Beaux Arts School, well "presented," and generally well drawn, but uninspired by any touch of architectural genius.

A remarkable exception is the very original *projet* by Monsieur Henri Defrasse, the talented son of the distinguished architect to the Bank of France, for a "Floating Island in the Atlantic." This set of drawings will be included in the collection representing the *Ecole Nationale des Beaux Arts*, to be exhibited at Grosvenor House in connection with the International Conference on Architectural Education. The idea is that in order to render possible an aeroplane service between America and Europe five or more such floating islands should be established in the Atlantic, where supplies of petrol could be picked up and repairs executed. The scheme is fully worked out, and is illustrated by some excellent drawings, in which careful draughtsmanship is allied to artistic ability, and was awarded a silver medal and the coveted *Prix du Palais de Longchamp*. This was founded in 1906 by the sculptor Bartholdi, with the sum paid him by the town of Marseilles for the *projet* of the *Palais de Longchamp*. It is awarded annually to a Frenchman under 30 years of age, "author of a work remarkable for its qualities of invention and imagination, in any category of art."

Among the other exhibits M. Bigot's design for the "New Thermal Establishment of Saint Nectaire" is an excellent example of the spacious and effective planning of an establishment of this type in which the natural advantages of the fine site have been considered.

M. Bigot also contributes a fine detail drawing, "An Institute of Art and Archæology," which shows an interesting brick treatment somewhat inspired by Assyrian examples.

M. Guilbert shows some of the best drawings in this year's exhibition in his plans and sections for "the Church of St. Joan of Arc at Versailles." The rendering of the sections is especially worthy of attention and is a silent but eloquent criticism of the hasty, slap-dash rendering which mars too many modern sets.

M. Nalamura, of Tokio, a past student of the Ecole des Beaux Arts, obtains a gold medal for an extremely able composition, "Maison du Japon à la Cité Universitaire," in which a good, practical plan is allied to elevations of a definitely Japanese character. The set is well drawn and rendered.

A native of Egypt, M. Edrei, is awarded a silver medal for a rather undistinguished design for the "*Palais du Justice* at Cairo," which is, apparently, the project awarded 1st premium and selected for execution in the recent international competition.

This year's exhibition was notable for the absence of the usual great projets of the Prix de Rome, &c., and for the number of water-colour sketches and "restorations." Most of these—especially the former—must have come before the jury when they were in not too critical a mood.

There are, however, one or two exceptions, such as the excellent drawings, executed for the *Commission des Monuments Historiques*, of the "Tower of the Church of Ploaré, Finistère," by M. C. J. Chaussepied, and the charming pencil sketches of various out-of-the-way corners by M. Trouvelot.

The remainder of the exhibits do not, we think, call for special notice; once again Great Britain is represented by a single set, a design for "Central Station (Buenos Aires), B.A.G.S.," by Mr. Arnold Mitchell. It is singular that English architects do not avail themselves of the opportunity which the Salon presents of reaching a much wider public (both British and international) than ever visits the crowded architectural room at the R.A. Exhibition.

Bartlett School of Architecture.

The following awards have been made at University College, Faculty of Arts (Bartlett School of Architecture):—

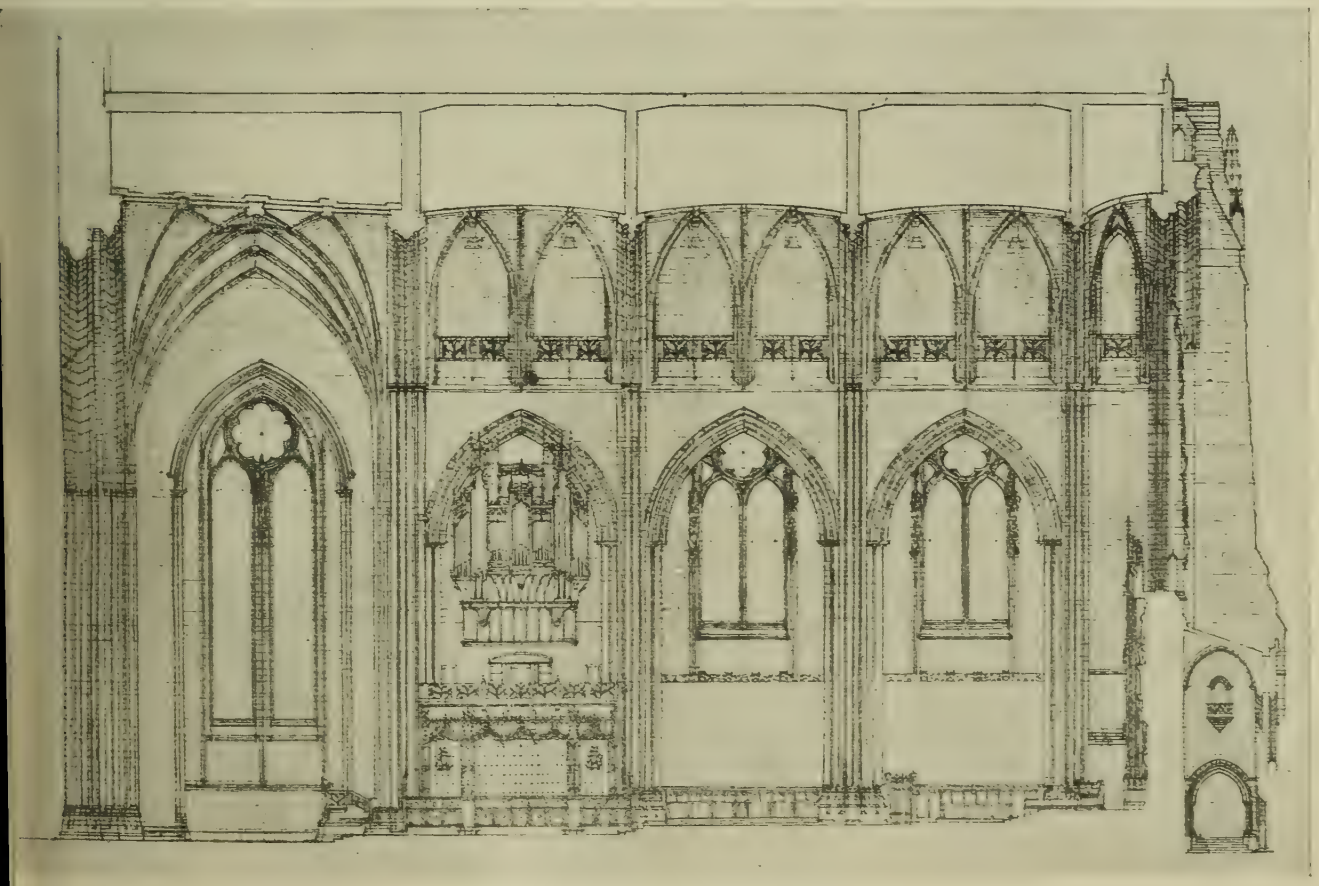
Lever Prizes in Architecture.—First prize (equal), Leonora F. M. Payne and C. H. Short.

Architects' Journal Essay Prize.—J. N. Summerson.

Herbert Batsford Prize.—P. A. Wailes.

Donaldson Silver Medal.—J. R. Alabaster.

Ronald Jones Prizes.—Mediæval Architecture, J. N. Summerson; Renaissance Architecture, H. Kendall.



Ronald Jones' Travelling Studentship.—C. H. Short.

Certificates in architecture, under the new regulations (three years' course) have been obtained by:—Penelope G. Carmichael, J. F. L. De Silva, Sylvia C. Gray, R. C. Grice, H. T. B. Griggs, H. A. Johnson, G. F. Kelly, J. T. Lloyd, D. M. Micklethwaite, Z. Panitch, Leonora F. M. Payne, Elizabeth C. C. Philip, S. D. Wheeler.

In the Department of Town-Planning:—

Lever Prizes in Town-Planning.—First prize H. W. J. Heck; second prize, L. M. Austin.

Certificates in Town-Planning were obtained by:—L. M. Austin, H. W. J. Heck, J. P. Blake.

LONGITUDINAL SECTION, LOOKING NORTH.

Liverpool Cathedral. Sir G. Gilbert Scott, R.A., Architect.

EVERY DAY IN EVERY WAY

By AN ARCHITECT.

It is the fashion to be pessimistic—the older men amongst us who have watched us grow up tell us that there are no draughtsmen like Norman Shaw and Street; our young friends regard us—those in the middle way of life—as being quite decent fellows, but lacking in courage. The young are bursting with ideas—the old are burning with resentment at being pushed out of their rut!

Do we deserve this? Do we lack aspiration or ideals? It is fair to say, and it needs to be said, that this generation is better than its forebears, and also that those who come after it will be better still. We have sat at the feet of our old men, and they have given us prejudices and habits—we have listened to our young men and they have shown us ideals without balance. The same tale has been told in every period of history. The old must learn from the young—the young must teach kindly and not impatiently the old, and we are not greater sinners than those of the past.

The pessimist may grunt if he will, the old man can sigh, but what is the truth? Was the level of design amongst the members of our art in general ever higher than it is to-day? We can see in our own lives the clamorous aspirations of our art to higher things. To review our own generation—what did we have in the bad old days? We had to pick up our art as best we could. There were no Universities with architectural degrees; no special arrangements with our masters to allow us to spend half our time at the University and half in the practical school of professional life. No ateliers—nothing or little but our own anxious labour. We spent years at cleaning stretchers and copying letters. If we loved our work enough we gained knowledge, if not we gained tricks of trade, and there are some to-day amongst us whose one claim to the right to work is that they can get work—how is sometimes best not inquired into—but that was what the times made. As to those who are to come, they will start not only where we left off, but ahead of us. The serious student of to-day learns for very little expenditure except that of enthusiasm and industry the finest styles from the finest masters, and starts better and well equipped. And as to those whose one claim to work is that they know how to get work—they are going. Every day they are less in number, and, it may not be in this generation, but before very long, they will be as rare as quack doctors are now, and as poorly regarded.

The pessimist is a nuisance in any walk of life, but he is a dangerous germ in the body of any art. Art is delicate—it thrives like all delicate things in the warmth of loving service and wilts and droops under the bickering of unmerited censure. The artist—the true artist, that is—is happy in honest and fair criticism in anything that will show him how he can improve the child of his imagination. He hates gratuitous and false praise, and loaths the sycophantic babblings of inanity. But the germ of pessimism, like the bacillus of consumption, will wear his being to a shadow, and—since he is only one of many in our body politic—can, if allowed to remain, turn it from a healthy body to that of a frail and ailing invalid.

As to these germs amongst us—these pessimists—thank heaven they do not hold the reins in our world! They are merely the horse-flies which sting and torment our faithful steeds. For the truth is much different to their tainted vapourings. Our buildings are better to-day than they were. There are architects to-day greater than Wren. There are engineers greater than Archimedes. There are violinists better than Paganini. I have yet to see draughtsmanship of the past to compare with that of poor Rickards. There may be arid stretches in the historic road of every art, but we are not passing along a flowerless route now, even though few of us are making the secondary consolation of big financial success.

Nor is that our only advance. The standard of professional honour is higher than it was when we were younger; it was higher then than what our masters remembered—they told us so—and it gets higher. Perfect it cannot be until the millennium is reached, but the millennium will be the end. We shall not reach it—I doubt if most of us would like to—to feel that all was done!

This is no plea for self-satisfaction. An artist, if he be one, is never satisfied with himself or his work, though he rejoices in the perfection of his confrères. That we have faults, and bad ones, no one would be so foolish as to deny, but to lament what has not died and abuse what is better than ourselves is vice—it is that of which the pessimist is guilty.

It is welcome to all to be criticised constructively. We have had a good example of this criticism recently in Prof. Richardson's address to the Architectural Association, some of it severe enough but suggestive and encouraging in its tone. And even he would not say that, for instance, the problem of the modern shop front is not better dealt with either in Burberry's building in the Haymarket or Selfridge's stores than it has been in the past. And though all of us who walk down Kingsway sigh for what might have been, there are few of the new buildings to be found in it that do not portray a vigorous and progressive spirit; whether we like or dislike what has been given us there, and even though we say that the modes are transitional, the transition is one moving towards better and greater things. Let us look round on the fine young men who help us so largely now and see with warming gratitude to our own more jaded and chilled spirits the fine enthusiasm and lofty ideals that animate theirs, and then let us deal with the germ of discontent as we would with the horse-fly. Our fathers were better than theirs, we are better than they were, and our youngsters are already better than ourselves.

It only needs candid, open consideration—the genial but mechanical exercises of our friend Coué are not needed—to see that we are getting better and better.

THE ART LOVERS' LEAGUE

We find ourselves in some agreement with the objects of this League, which aims "to unite artists and public in the support of sane, healthy and progressive art." The marked originality of the creative mind must not be confused with merely neurotic tendencies and theoretic extravagance. All the finest men are nonconformist, as Emerson pointed out, so that it is not at all an easy task to steer a society with such aims between the rocks of mere orthodoxy and those of creative art. At the same time the League would appear to have clear convictions as to its objects, which, well handled, should have a corrective and educational value at the present time.

Dr. Hyslop, M.D., gave recently on behalf of the Society at Leighton House a lecture with illustrations on "Disease in Modern Art," and explained, in the course of his remarks, the art and art impulses of the mentally deranged, aided by illustrative slides and a series of reproductions. Mr. Julius Olsson, R.A., presided, and a number of new adherents were secured for the League. The lecturer declared, in reference to some of the reproductions shown, that those critics who attempted to place such works in the forefront of contemporary art must either be dishonest or on the borderland of insanity.

The manifesto of the League in formulating the reasons for support to such a body, points to the assiduous advocacy of doctrines in favour of dogma and eccentricity, and that those have been forced on the public in every possible way. As a consequence, work of extremist and incompetent character has been foisted on the national art collections of England and the Dominions. That there is room for serious criticism on this side we have pointed out before, but without much improvement in public taste a remedy is not easily to be found. Such a League, however, in emphasising these dangers may contribute usefully to reform. The public, far too easily led, surrenders its own judgment, and instead of exercising more independence in regard to such matters, invests the critic and the expert with a sort of infallibility. Otherwise we should not witness the acquiescence of the public with some of the works exhibited in our permanent collections. The extremists, however, we are inclined to think, have had their day, and though we would wish to curb in no way the adventure into new fields or yet untrodden ways, we shall in the future be less deceived by that which, proclaiming discovery, achieves only solecism.

There is little doubt but that contemporary criticism is largely responsible for the endorsement of much of the theory and extravagance which has granted so long a lease to incompetence. The confusion in regard to the nature of art and the primary principles which govern it has led us to incorporate insanity as one of its resources. But it is only in spite of such insanity that the natural powers of the artist, though clouded by a defective mental condition, give us such results as we associate with Ganguin, Van Gogh and others. An artist responding to the creative impulse whose nature is deformed by cerebral disorder achieves what that state produces; and when we add to this the further disorder of a wholly undisciplined life, we reach those results which some critics have discovered to be the new art, *i.e.*, deformity and eccentricity. This wholly unnatural state of things has worked infinite harm to the cause of true art.

As a passage in the League manifesto tells us: "While the public interest in sane art is actually on the increase, the public, owing to the continuous laudation of works of no merit, has become so bewildered concerning contemporary art that the purchases of it have been greatly reduced." We think there is something to be said for this view, but would like to point out to the League that it occupies very difficult ground to work on. If it distinguishes the spirit of adventure from mere perversity, perceives that art is to be valued not because it is orthodox but because it is art, keeping the doors wide open to the spirit of our own time, its aspirations and new unfoldings, it may do useful work in distinguishing jewels from mere glass. In giving a new and sounder direction to our choice than the mere vagaries with which we have so often been exploited over the last years the League should do useful service.

Manchester School of Architecture.

The result of the June Examination is as follows:—

B.A. (Honours Architecture).—Final, Kathleen O. Brayshaw. Part I, W. H. McNichola Eldon Alexander.

Intermediate R.I.B.A. Exemption.—Kathleen O. Brayshaw and Frank Whiteley.

Final R.I.B.A. Exemption.—Elsie Rogers, W. A. Norbury, P. Fairhurst, R. J. Willis and W. Owen.

The following travelling scholarships have been awarded:—

Manchester Institute of Builders' Travelling Scholarship.—£70, Elsie Rogers; £60, R. J. Willis; £50, Kathleen O. Brayshaw.

R.I.B.A. Travelling Scholarship.—£50, G. Graley.

The Heyseed Prize.—£10, W. H. McNichol

Kneeler Ends of Desks in Front of the Bishop's Throne. Carved by Mr. H. G. Ratcliff to the Architect's design.

This week we give some further drawings of Liverpool Cathedral, of which Sir G. Gilbert Scott, R.A., is the architect.

House at Limpsfield.

This house is now being built. The walling is built partly of old Tudor 2 in. bricks and partly of bricks from Messrs. Pascall, of Wrotham. The roof is also a mixture of new and old tiles. The woodwork throughout is mainly oak. The builders are Messrs. G. E. Wallis & Sons, Ltd., of Maidstone. The heating engineers are Messrs. Colley, Meikle & Co., Ltd., of 15, Great James-street, London, W.C. 1. The electricians are Messrs. Tyler & Freeman, of 40, Chancery-lane, London, W.C. 2; and the garden by Messrs. Cheal, of "The Nurseries," Crawley.

Messrs. Baillie Scott & Beresford are the architects.

House at Arnside, Westmorland.

This house has been erected on a beautiful site on the road to Jacob's Bay, under Arnside Knott, at the head of Morecambe Bay, and fine views are obtainable. The walls are brick with rough-cast face, and the roofs are covered with tiles of varied colour. The whole of the windows are in leaded lights in wood frames with metal casements to opening portions.

Messrs. Rainey Bros., of Barrow-in-Furness, were the contractors. Mr. C. B. Pearson, F.R.I.B.A., of Lancaster, was the architect.

House at Barnsley, Yorkshire.

This house, standing on a hilly site on the outskirts of the town, has been built of Yorkshire sandstone from Rivelin Quarry, Sheffield. The face of the stonework has been hammer-dressed, and in colour is of varying yellow and brown tones. The roof is covered with rustic slates, which blend with the colour of the walls.

The general contractors were Messrs. T. Roper & Sons, Ltd., of Sheffield; and the slating was carried out by Messrs. Roberts, Adlard & Co., Ltd., of London. The architects are Mr. Arthur Wm. Kenyon, F.R.I.B.A., and Mr Stanley G. Livock, A.R.I.B.A. The perspective drawing is by Mr. Cyril A. Farey.

Wood Carving at Liverpool Cathedral.

We illustrate this week some of the wood-carving work in Liverpool Cathedral which has been carried out by Mr. H. G. Ratcliff, of Cathcart Hill, London, N. The choir stalls were given by Lord Waring, and were made by Messrs. Waring & Gillow, Ltd., Mr. Ratcliff doing the carving for Messrs. Waring & Gillow.

The wood carvings for the Bishop's throne and adjoining clergy seats, the clergy seats opposite the Bishop's throne, and the fourth organ case were carried out by Mr. Ratcliff for the architect, Sir G. Gilbert Scott, R.A. The Royal chairs and faldstools, and the tall oak reading desk were also made and carved by Mr. Ratcliff for the architect. An effort has been made by the carver, who started on the work in 1913, to impart the character of *wood-carving* to the work, which is both vigorous and ecclesiastical in general effect, though it is by no means a copy or imitation of old work. An attempt has been made in the figures in the desk ends of the Bishop's throne and the choir stalls to carve them as they might have been carved by one of the old monks who had never learned anything about carving, but who wanted to carve some figures to fill niches which had been left vacant.

Old House, Sundridge, Kent.

This interesting old house, which, for many years had been used as three cottages, has been restored and adapted for residence. The front is characteristic of Kent and Sussex work of the late Middle Ages, and the interior consists of a central hall opening on the left-hand through a screen to the bakery and kitchen, and on the right to a withdrawing room. The insertion of brick chimneys, however, altered this arrangement. The original windows were without glass, and the remains of a central hearth in the hall were found under the floor. Porches have been erected in front and a new kitchen wing and staircase behind.

The builder is Mr. C. P. Munn, of Hampstead; and the architect is Professor Beresford Pite.

MEETINGS

FRIDAY, *July* 25.

Architectural Association. — Annual Prize Giving. Address by the Right Hon. Winston Churchill. At 35, Bedford-square, W.C.1. 3 p.m.

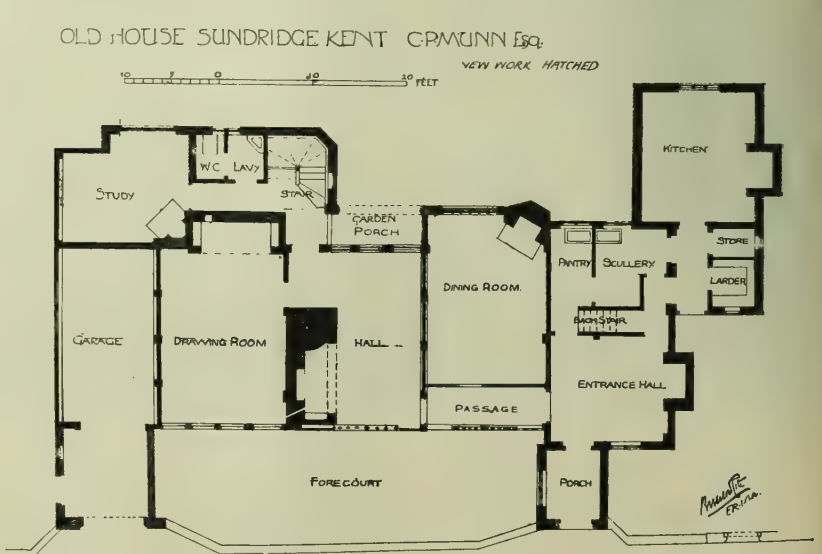
MONDAY–SATURDAY, *July* 28–*August* 2.

Royal Institute of British Architects.—International Education Congress. At 9, Conduit-street, W.1.

BOOK REVIEW

Pittura Italiana Antica e Moderna. By ALFREDO MELANI. 4th edition. (Ulrico Hoepli, Milan. 1923. L.48).

THIS history of Italian painting, which is most attractive both in contents and appearance, has deservedly reached a fourth edition. Professor Melani has given us a faithful presentation of facts, accompanied by suggestive comments. Every style of painting receives sympathetic treatment, for the author loves art in all its manifestations. Notwithstanding its brevity (it consists of one volume only, of the usual format of the Hoepli manuals) this book gives much more than a mere outline of the subject. Many artists of secondary importance are mentioned and the author has indicated the essential features of each — sometimes in no more than a few words, but his criticism is so penetrating and varied that all monotony is avoided. It would, indeed, be hard to find a more interesting work of the kind in one volume.



In this new edition more space is given to Barocco, of which the Professor has always been an ardent defender, and a chapter on contemporary painting has been added. The author has also increased the number of pictures and frescoes mentioned—not "out of vanity," as he says, "but to permit the reader to add to his knowledge and offer him the means of making wider comparisons." The great number of modern examples Professor Melani is able to cite is due to his habit of making daily, "almost hourly," notes of what he sees.

For the sake of their strength and suggestiveness, their mental and psychological value, "which exceed those of the finished picture," a number of sketches are included amongst the 198 illustrations. Many of these are reproductions of Italian work abroad, which is not so generally known. In speaking of the International Exhibition of Modern Art at Rome, the author praises the virile energy of contemporary painting. The English work exhibited receives its fair share of praise, but the water-colours sent to Milan in April, 1923, are less favourably criticised. Of these, the Professor remarks that they showed a strong adherence to the classic tradition and formed a marked contrast to the free modernity of the Lombard work in the same exhibition. "Personality, the conquest and glory of the present epoch"—those are his words; and he goes on to say: "Italy is not a faro spento; she knows she is heir to an immense patrimony and she will add to it."

LEGAL SECTION

NOTES ON CURRENT CASES

Covenants to Repair: Damages for Breach.

In our Legal Section, May 30, we noted a case, Hewitt *v.* Rowlands, in which the point raised was the liability of a lessor under a covenant to "keep the premises dry" towards the tenant of an old house.

That case was appealed immediately after the note was written, and the report of the decision was published the day after *The Builder* for May 30 was published. We shall show below that the Court of Appeal agreed with the Divisional Court that the District Registrar had wrongly directed himself as to the principle on which the damages should be assessed and, having obtained further particulars from the Registrar, the case was remitted to him.

In dealing with this case, we reviewed certain cases relating to covenants in connection with old houses, and as will be seen when we come to deal with that case the Court of Appeal acted upon the decisions we cited; but on the subject of repairing leases generally, we referred to the decision given by Mr. Justice McCardie in Calthorpe *v.* McOscar, a judgment which was reversed by the Court of Appeal in December last, but which was not reported in the *Weekly Not s* or *Law R ports* until a full report was given in June (1924 1 K.B. 716).

This is a case of very great importance, so in the present note we take that first.

The houses in question in that case were newly erected houses at the commencement of the lease in 1825, the term of the lease was 95 years, with a repairing covenant which was summarised by two members of the Court of Appeal as "To well and sufficiently repair, support, uphold, maintain, paint, pave, empty, scour, cleanse, amend, and keep the three several messuages, with all manner of needful reparations whatsoever, and to yield them up at the end of the term well and sufficiently repaired, supported, &c., as aforesaid." It was not disputed that there had been a breach of covenant, but the point raised in the case was the nature and extent of the repairs which were necessary at the end of such a lease for the due performance of the covenant.

This question as to the assessment of damages had been referred to an arbitrator, a surveyor, who had assessed the sum on a double basis according to the two views put before him on behalf of the parties. The lessors said that under the covenant the lessee had to do all necessary acts well and sufficiently to repair, but for the lessees it was contended that the repairs need only be such as, having regard to the age, character, and locality of the premises, would make them reasonably fit to satisfy the requirements of reasonably minded tenants of the class that would be likely to occupy them.

On the first basis the damages were assessed at £586, and on the second basis at £229, and Mr. Justice McCardie had decided that the latter was the right assessment. During the hearing the Court of Appeal had asked the arbitrator to give information as to how the difference in the figures had been arrived at, and Lord Justice Bankes referred to his report "as a very clear and enlightening statement which demonstrates better than anything else could do how misleading a test of the obligation under a covenant to repair the supposed wants of an intending tenant at the expiration of a long lease may be."

We have not space to set out that document here, but the arbitrator explained that the principal difference between the figures arose in connection with outside and structural repair, although there was a difference also in connection with inside repairs. In the lower estimate, as regards outside repairs, only such repairs were practically included as would satisfy the requirements of the local authority. The report summarised the matter under two headings as regards the larger sum, but we only give the first as Lord Justice Bankes is reported as having said, in his judgment: "To most people head *a* will, I think, prove the more useful guide." That heading read as follows: "The higher sum in my award is my estimate of the cost of doing all needful and necessary acts well and sufficiently to repair, &c., the premises in the words of the covenant, which I took generally to mean the cost of putting the premises, (*a*) into such a condition as I should have expected to find them in had they been managed by a reasonably minded owner, having full regard to the age of the buildings, the locality, the class of tenant likely to occupy them, and the maintenance of the property in such a way that only an average amount of annual repair would be necessary in the future."

Then, as to the lower sum, the report expressed this as "the estimate of the cost of such repairs as would satisfy the literal requirements of reasonably minded tenants of the class now likely to occupy the premises, who would not accept any repairing obligations, with such additions as would be necessary to avoid the receipt of notices from the local authorities. Such repairs would not include many repairs necessary for the maintenance of the structures in accordance with (1) (a) and (b) above, the neglect of which, however, would not (1) interfere with the immediate comfort of the occupiers and so come within their requirements, or (2) cause danger to health and so come within the purview of the local authorities."

Mr. Justice McCardie based his decision on the case Proudfoot *v.* Hart (25 Q.B.D. 42), and in our note on his decision. November 16, we pointed out that case only applied to certain woodwork and we could not say whether the question of any change in the character of the locality was argued, but the Court of Appeal have now pointed out that Proudfoot *v.* Hart was a case where the tenancy was only under a three years' agreement, and that in such circumstances the class of tenant at the end of the tenancy would not differ from the class of tenant at the commencement of the tenancy and, therefore, that case only applies to terms of that nature. But further than this, at the hearing in the Court of Appeal, a case was cited Morgan *v.* Hardy (18 Q.B.D. 646), also a decision of the Court of Appeal, in which the contention between the parties was in substance the same as that raised in this case, and the Court had negatived the contention there put forward on behalf of the lessee. In the *Law Reports* no reference is made to the decision on this point when the case was before the Court of Appeal, the case being reported on another point, but in the *Weekly Reporter* (35 W.R. 588) mention is made of the point, and Lord Justice Bankes in the present decision is reported as saying that it appears almost contemptuously to have been rejected by the Master of the Rolls, Lord Esher, who was also a party to the decision of the Court of Appeal in Proudfoot *v.* Hart. Lord Esher is reported as having said, "As far as I understand this contention it is that the fact that a neighbourhood has deteriorated ought to decrease the measure of damages for a breach of a covenant to leave in repair. I think that such a proposition is wholly untenable and that every case is to the exact contrary." Lord Justice Bankes pointed out that the principle as laid down in head (1) (*a*) by the arbitrator in this case, the age of this building being the dominant feature and the class of tenant only considered in relation to the age of the building, if applied to the facts of Proudfoot *v.* Hart, would have produced the same result in that case as did the rule laid down by the Court in Proudfoot *v.* Hart.

We think the general effect of the decision is given by the following passage taken from the judgment of Lord Justice Scrutton: "Therefore in my view we are bound to look at the character of the house and its ordinary uses at the time of the demise. It must then be put in repair and kept in repair. An improvement of its tenants or its neighbourhood will not increase the standard of repair, nor will their deterioration lower that standard. It follows in this case that the principle put forward by the tenant was erroneous, and that the statement by the arbitrator in 1 (a) is accurate but must be limited to conditions at the time of the demise."

It appears from the judgments that the question of age comes in as to what is repairable and what amounts to reconstruction according to the rule in Lurcott *v.* Wakely (see below).

In our note of May 30 on the case Hewitt *v.* Rowlands, we only referred to Mr. Justice McCardie's decision for a subsidiary purpose, that is his observations on the effect of the various expressions used in covenants to repair, and on this point he received a certain amount of support from the Court of Appeal. Thus Lord Justice Bankes is reported as having said: "I attach no particular importance to the particular form of words used in the covenant. The effect is the same in my opinion, whatever words the parties use, provided they plainly express the intention that the premises are to be repaired, kept in repair, and yielded up in repair. In the present case the covenant was one in reference to newly-erected buildings, and the question, therefore, does not arise, which in some cases is very material, of the effect of the covenant to repair when at the time the covenant was entered into the buildings to which it applies are old and dilapidated. Considerations which arise in such a case were discussed in Lurcott *v.* Wakely."

Lord Justice Scrutton is reported as having said: "In my view the matter can be dealt with as if the covenant were one to 'keep and yield up at the end of the term in repair.' I do not think there is any substantial difference in construction between 'repair' which must mean 'repair reasonably and properly,' and 'keep in good repair,' or 'sufficient repair,' or 'tenantable repair,' or most of the various phrases cited to us. There is an analysis of the meaning of 'repair' in Lurcott *v.* Wakely with which, as far as it goes, I agree."

Lord Justice Atkin, in his judgment, does not appear to approve taking a number of terms which may be found in various leases, treating them all as synonymous, and so imputing to all of them a special meaning attached by authority to one of them, but there is one point in his judgment which should be especially noted. From the above judgments it may have seemed impossible to see what effect remained to be given to the decision in Proudfoot *v.* Hart, but Lord Justice Atkin refers to this case as follows: "Unguided, I should have thought that the original and proper sense of 'tenantable' was fit to be tenanted, that is, 'occupied,' and that the word meant no more than if it meant as much as 'habitable,' but Proudfoot *v.* Hart binds me to hold that in a three years' agreement it has reference to the reasonable requirements of a tenant of the class who would be likely to take the house. Accepting that construction I have no doubt that the requirements of such a tenant are deemed to continue the same during the term, or if not are to be estimated by the requirements of such a tenant as would be likely to take the premises at the commencement of the term."

We now come to the second case, the subject of our former note Hewitt *v.* Rowlands (*Weekly Notes*, May 31), which comes within a different category, being just such a case as was differentiated by the Court of Appeal in Calthorpe's case, as the house was old when the lease was entered into. It is unnecessary to recapitulate the facts which are stated in our former note. It was a cottage, the outer walls of the older portion of which were some 150 years old, being of red sandstone, additions having been made

t 80 and 60 years ago of brickwork and er, but in no portion was there a damp e. It had originally been let to the tiff in this action in 1875 for a term of years, but at the expiration of that term enant had remained on from year to year. defendant had become the owner of the sion in 1920. On March 31, 1921, he had the tenant notice to quit, but the tenant hen remained on as a statutory tenant under Rent Act. On November 26, 1921, the nt had given the defendant notice that cottage was very damp, and called upon to make it damp proof under the terms of original agreement, whereby the then lord had undertaken to "keep the cottage and the outside in repair." The cost of g this was estimated at £600; the rent of cottage was £60.

the Court of Appeal judgment had been red for the tenant, the plaintiff, but the ages had been referred to the District strar for assessment. The District Regis- had assessed the damages at £30, which ared to be in respect to some special age to a piano, pictures, &c., but he had that as the tenant had expended nothing oing repairs for which the defendant was e, he could only recover such pecuniary loss damage as he had suffered through the ndant's default. The Divisional Court had he was wrong in so directing himself and tted the case to him, and this was an al from the decision of the Divisional t.

he Court of Appeal referred to the District strar for further information as to how had arrived at the sum of £30, and the strar informed the Court that the sum was e up in respect of damage to articles of the ntiff, and a sum of £5 general damages, that he had proceeded on the view that as not in the contemplation of the parties n the agreement was entered into that er the covenant the tenant should be tled to recover any damages, beyond the al loss or expense to which the tenant nt be put, through the landlord's default, were such damages to be increased by the nt remaining in possession after the tenancy been determined in accordance with the s of the agreement, and that as the tenant not done any repairs, nor incurred any nses in connection therewith, he had con- ed the sum of £5 adequate as general ages, and in arriving at that figure he had n into consideration the fact that notice ant of repair had not been given by the nt until after the notice to quit had been ved from the landlord.

he Court of Appeal held that the Divisional t was right in holding that the Registrar misdirected himself, but intimated that as d seemed likely that he had not only mis- ted himself on the question that it was ssary before the tenant could recover he actually have spent the money to do the ssary repairs, but also upon the position the nt occupied as a statutory tenant under the Act they had referred to him for further rmation. It now appeared to the Court that he view of the Registrar the fact that the nt remained as a statutory tenant disen- d him to any damages beyond what he had ed as tenant under notice to quit under riginal agreement, and that the measure of damage would not include anything except the tenant might pay out of pocket in the repairs that the landlord ought to have

The Court held that the Registrar was g on both points, (1) the Rent Act had no g on the case as the tenant, as statutory t, was entitled to the performance by the rd of his obligation to repair under the ment, but (2) that obligation did not arise notice was given to the landlord of want air, but the breach was a continuing breach damages should be assessed down to the f assessment. Lord Justice Bankes held *prima facie* the measure of damage for of the obligation to repair is the difference lue to the tenant, during that period, en the house in the condition in which it , and the condition it would have been in had the landlord fulfilled his obligation, but, that in assessing the damage on these lines the difficult question is the extent of the landlord's obligation, for it is necessary to consider whether in view of the age of the structure the damage is really the result of the landlord's failure to do something he was under obligation to do; the main cause of damage appeared to be the saturation of the stone through the absence of a dampcourse, and the Registrar must consider whether on the facts the case fell under Lister *v.* Lane, as explained in Lurcott *v.* Wakely, and so much of the damage as he found due to dampness caused by defects which the landlord was not bound to remedy must be excluded from the assessment.

Lord Justice Atkin agreed with the above opinion as expressed by Lord Justice Bankes, but added that the Registrar must approach this question under Lister *v.* Lane without considering whether it is convenient or profitable to the landlord to fulfil his obligation. He also pointed out that as regards the damage to special articles of the tenant he would have to consider whether it was done in whole or in part before the landlord's liability arose, that is before or after the notice of want of repair.

In our Note of May 30 we referred to the case Lurcott *v.* Wakely and set out the facts and gave the test, as laid down by the then Master of the Rolls, that the question to be considered is, Has the subject matter of the demise so changed that the operation of repair involves the creation of practically a new structure? In that case the taking down of a wall was held only making good a subsidiary portion, but Lister *v.* Lane (1893 2 K.B. 212), was a case where a house had been erected on a timber platform, and the repair required was held to go beyond "repair," and to amount to reconstruction, and Torrens *v.* Walker (1906 2 Ch. 166, *The Builder*, May 19, 1906), affords another example of this as when notice of want of repair was given by the tenant the premises were held to be irrepairable.

Conversion into Flats.

An important point has been decided by a Divisional Court in the recent case Abrahart *v.* Webster (*Weekly Notes*, June 21, 1924). The appellant was the landlord of a dwelling house at Hove which consisted of a basement, ground floor and two upper floors, the standard rent of the whole house as on August 3, 1914, being £60. The landlord had purchased the property in January, 1921, and in 1923 he had converted the ground floor and the two upper floors into two separate and self-contained flats. The respondent had been tenant of the basement as a separate tenement since February, 1921, at a weekly rent of 11s. 9d.

In January, 1924, an apportionment had been made, on the application of the respondent, fixing the standard rent of this basement at one-fifth of the standard rent of the house (£60), and the landlord appealed from this decision.

The County Court judge had found as facts that the newly constructed flats could not be identified with the house as it was before conversion, but as the basement derived no benefit from these alterations and was occupied by the respondent before the alterations were commenced, it remained as it was and formed no part of the ground and upper floors which had been converted into two separate and self-contained flats, and he had apportioned the rent in respect of that.

It was argued for the landlord that under section 12 subsection (9) of the Rent Act, 1920, the premises were taken out of the operation of the Act, having been reconstructed by way of conversion into two or more separate and self-contained flats since April 2, 1919, whilst the tenant's contention was (1) that as the tenancy began before the alterations were made the subsequent reconstruction did not affect the tenant's right to an apportionment and (2) that as the basement had not been touched there had been no reconstruction of the house as a whole and, therefore, section 12 subsection (9) did not apply.

The Divisional Court, reversing the judgment of the County Court judge, held that the word "dwelling house" in that subsection must be construed in its ordinary sense, and that it refers to the whole structure as a unit, and as here the house regarded as a whole had been reconstructed by way of conversion into two or more self-contained flats, the basement could not be regarded as a separate dwelling house.

This point was really decided in Stockham *v.* Easton (1924 1 K.B. 52 *The Builder*, May 18, 1923) where part of the house had been converted into separate flats, but no practical reconstruction had taken place as regards the first floor which had been let to a tenant whilst the work of construction was still in progress. This tenant applied subsequently for an apportionment of the rent, and in the County Court his application had been granted. On appeal by the landlord, a Divisional Court held that the house must be regarded as a whole. Mr. Justice Lush is reported to have said the proper view was to regard the house as a whole; "and if it be found that the structural alterations to the whole house have been such as to cause it as such to lose its identity, and directly or indirectly to affect the separate floors or rooms in it, then to treat these floors or rooms as having themselves been altered in a substantial manner and as being no longer the same as they were in 1914."

In the course of that case it was found as a fact that the first floor had derived direct benefit from the reconstructural operations, and this is also referred to in the judgment, and it was this fact and the fact that the tenancy commenced before the alterations that made the County Court judge distinguish that case from the one he was considering (Abrahart's case), but from the short report at present available of Abrahart's case it appears that it is the loss of identity of the house as a whole which has to be regarded, not the identity of any particular portion of it.

Options to Purchase.

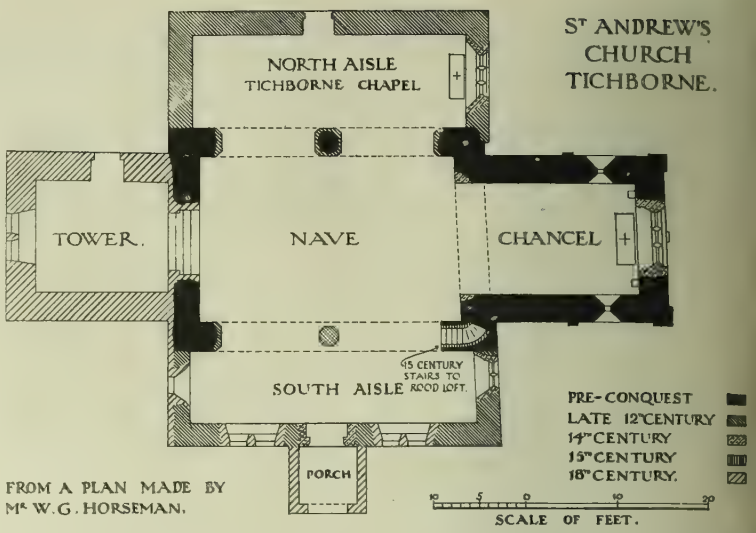
The Court of Appeal is so abreast of its work that a case is hardly noted in the Courts below before, if it is appealed, a further note is necessary. Thus we must at once call attention to the fact that the case Sherwood *v.* Tucker, which was reported in the *Weekly Notes*, May 10, and noted in our Legal Section, June 27, has been reversed on appeal.

It will be remembered that in an agreement for a three years' tenancy an option to purchase was contained giving the tenant the right to purchase the house "during the three years hereby provided for." Before the expiration of the term the parties had by endorsement extended the agreement as follows: "We, the undersigned, hereby agree that this lease be extended for three years expiring December 25, 1920." By a similar endorsement there had been a further extension for three years.

The Court below with some hesitation had held that these endorsements were intended to extend the whole lease with its terms, including the option, but the Court of Appeal has reversed this judgment. The Court again laid down the point, which will be found referred to in our former note, that an option to purchase is not part of the lease but a collateral independent contract, and said therefore it was important to approach the question bearing in mind the essential difference between the demise and the option, and pointed out that although a landlord might be prepared to give the tenant an option to buy at a fixed price for a definite period, it would be another thing that the option should be held as continued by an extension of the lease, and here the words used by the parties were adequately interpreted by referring them to the demise, and the demise only, and to hold that the words, "that this lease be extended for three years," referred to the continuance of the option would be to give them an arbitrary meaning. The Master of the Rolls stated that the other case, also noted in our Legal Section, June 27, Batchellor *v.* Murphy, was being appealed, and that therefore the Court would say nothing about that case at present.

THE CATHEDRAL CHURCH OF LLANDAFF

Mr. W. E. Lovegrove recently lectured before the Royal Archæological Institute on Llandaff Cathedral.



In the course of his remarks he said it might fairly be claimed for the See of Llandaff that it was the oldest in Great Britain, and that it might be put forward on behalf of the Cathedral Church that it contained the oldest work of any architectural importance in Wales. At Llandaff they had remains of Bishop Urban's choir, begun in 1120, and a building of great artistic merit. Documentary evidence relating to the fabric was unusually scanty. A careful search had only enabled him to find four or five notices bearing upon the fabric of the Cathedral Church. They had the date of the beginning of the work, 1120, and they also knew that the building of the new church did not entail the destruction of the old, for the work was begun on April 14 and seven weeks later, on June 2, the body of S. Dubricius was solemnly buried in the old Minster.

In the absence of any known foundations they could only guess where they must look for the side of the old Minster. One fact might have some bearing on the question. It was one of the peculiar characteristics of the site that the Cathedral was built so close to the steep hill-side that a certain amount of excavation must have been necessary. There was no apparent reason for this, as there was now plenty of room to the north, where the ground occupied by the present churchyard was quite level. It might be then that the old church stood on the north side of the later building, and that room for the new cathedral could only be found by cutting into the hill-side in the manner which seemed to them to-day to be so unnecessary. However that might be, it was clear that no immediate destruction of the old Minster was contemplated.

In regard to the fabric itself it was quite easy to recognise certain parts of the building as of Bishop Urban's time. These were the east wall of the presbytery and the main fabric of the south wall. The east wall was pierced by a noble archway as at Hereford, but the Llandaff Arch, being of considerably later date, was of a much richer character.

The south side of the presbytery contained portions of two Norman windows, which had been cut into by arches inserted beneath them in the fourteenth century.

The west front, which was certainly one of the most beautiful compositions of its time, and well worthy of all the praise that had been lavished upon it, was apparently the work of two periods, and had been carried out under two master builders. He spoke, of course, of the earlier parts, as they were not concerned at the moment with the fifteenth-century additions. It had not, perhaps, been noticed that they had two different types of design, both, he believed, modelled on Wells, and represented first by the nave and transept, and second by the west front. No church in Wales could compare with Llandaff in purely archæological interest. It was full of problems for those who sought them; some fairly easy to unravel, others more difficult, and others again impossible of solution.

Town Hall for Springs, South Africa.

His Majesty's Senior Trade Commissioner in South Africa (Mr. W. G. Wickham) has forwarded to the Department of Overseas Trade a report to the effect that the town of Springs, South Africa, is considering the question of building a new town hall, and has entrusted the preparation of plans to two architects. Firms desirous of offering British material and fittings can obtain the names of the architects upon application to the Department of Overseas Trade, 35, Old Queen-street, London, S.W. 1.

TICHBORNE CHURCH

An appeal for £850 for the restoration of Andrew's Church, Tichborne, is now being m The orginal building, *i.e.*, the chancel and n probably belong to a date prior to the Nor Conquest, the thickness and construction of walls, the double-splayed lancet windows, the external narrow pilasters being sign Saxon work. In the eleventh or early tw century the north and south aisles were adde the nave, arcades being pierced through north and south walls. In the north aisle is Tichborne Chantry, founded by Sir Roger T borne in the reign of Henry I. This aisle practically rebuilt by the Tichborne family s years ago; the chantry contains many m ments of the Tichborne family, notably on memory of Sir Benjamin Tichborne, the Baronet (1620). In the fourteenth century narrow Saxon chancel arch was replaced by present wide one. The stonework of the window belongs to the same date. The old pews, some of which are well carved, date f the reign of Elizabeth.

Some time ago cracks were observed in east wall of the south aisle, and the wall shored up with timber. The cracks, howe appeared to be spreading; the Church Co decided to call in expert advice, and Mr. T Atkinson, F.R.I.B.A., was consulted advised certain works.

St. Andrew's Church, Tichborne.

THE ROYAL SANITARY INSTITUTE

ANNUAL CONGRESS AT LIVERPOOL.—I

The annual congress of the Royal Sanitary titute always arouses a considerable ount of public interest in the city in which is held, and this year's event, which was d at Liverpool from July 14 to 19, proved exception to the rule, for in addition to the ge number of members and delegates esent, the conferences of the different sec-ns were well attended by the general public. The interests of the Institute cover a very le range, from medicine to building con-uction. The chief interest for architects l builders was in the section of Architecture l Construction, in which a number of eresting papers were read, of which ab-acts and reports of the discussions are given ow.

SECTION OF ENGINEERING AND ARCHITECTURE.

Presidential Address.

Mr. John A. Brodie, M.Inst.C.E., who ed as President of the Section, in his esidential Address dealt chiefly with the ject of housing. He said the question of cost of sites for rehousing often loomed large in the views of those responsible, l it was sometimes overlooked that even nparatively heavy site costs could, by icious planning and arrangement, be so dified as to form little greater charge to the ividual house than in the case of the outer as where the cost of land was cheap but number of houses to the acre very limited. ne little time ago a not unusual type of velopment for even comparatively expensive n sites was the individual cottage standing its own area limited in size only by the nimum open space and other conditions re-red by the by-laws. More recently blocks flats limited to three or four stories had n more generally adopted, and were giving isfactory results, but in some such cases had been customary wherever more expen-e sites had been purchased than those of demned property to write down the value he site to a merely nominal price per square d, and even then the return on cost was sufficient to meet outgoings.

n London recently he had an opportunity of wing modern blocks of dwellings of five ries in height, with ample areas for light l air, both at front and back. An electric of automatic type was available for use each householder, the distribution from the being by way of balconies to the individual ellings. Stairways were also provided for se who cared to utilise them, and, though able of improvement, in detail, this system peared to have a number of excellent tures. In Paris, blocks of dwellings eight ries in height, of very satisfactory appear-ce and character, had recently been com-ted, but notwithstanding the height of the per stories no lifts were provided. Much her blocks of residential flats were found isfactorily to meet the requirements of those iring to live in central positions, and able pay high rents, in London and other large tres, where efficient lifts were provided.

Although the demolition of small sections of nitely insanitary dwellings and the re-sing of those dispossessed was very gener-looked upon as the most pressing need in gested town areas, other almost equally portant matters were involved and often rlooked, and it was probable that the com-e replanning and reconstruction of many unhealthy sites on a more generous scale ld on the whole give more satisfactory lts both from the sanitary and from the eral amenity point of view. The erection blocks of buildings of a height properly portioned to the roads and open spaces lable, completely equipped with modern giving easy access to all floors and avail-at all hours, would appear to be one of lines of treatment which should be very carefully looked into as a solution having some essential possibilities in connection with the rehousing of the lower-paid workmen in positions within easy reach of their work. Especially was this the case wherever main arterial roads were necessary, and replanning of considerable areas became possible. In such cases the roadway, which should be of ample width, provided in itself the distance between the fronts on which the living rooms would look out, whilst at the back with buildings of the height suggested ample open space between buildings could be provided of approximately similar width.

Calculated on such a basis, including one-half road and back space, it was clear that such a number of dwellings could be erected as would meet the full normal dwelling requirements for most congested areas, whilst the site costs distributed over such a number of dwellings would allow of fairly expensive sites being utilised for such a purpose without throwing an excessive charge on each dwelling. On the question of health no question need arise where due attention had been paid to the provision of open spaces, and ample access for sunlight and air. One of the advantages of such a solution, if found to meet the requirements of the occupants, would be that where applied through poor neighbourhoods it would enable a more or less continuous system of demolition, erection, and transfer of residents to the new buildings to be adopted, and thus help to remove the present difficulty of getting possession of vacant dwellings so that the sites might become available for building purposes. With proper Government help on such lines, he thought it would be found quite possible to do away more quickly with many areas which at present were hardly creditable to the governing authorities, and were only excusable on the ground of the specially difficult conditions at present surrounding the whole question of cheap house building.

After some remarks on the treatment of partly-developed and undeveloped sites, the speaker dealt with the question of building labour and material. Perhaps the most important and most serious problems in connection with housing just now were, he said, those of the supply of skilled labour in combination with the question of reduced output for wages paid, and the rising prices of materials due largely to controlled output, which together bid fair to make the provision of homes for the lower-paid men very difficult at any cost within the capacity of those who in rates and taxes appeared fated to provide a very large proportion of the additional burden of cost needlessly inflicted upon them.

Training in a skilled trade was not now absolutely necessary for the earning of high wages, and many men who a few years ago were quite unskilled labourers were now earning a higher standard of wages than fully trained engineers whose trade required great skill and a long apprenticeship. The lessons of the munition period had not been entirely thrown away on thinking workmen. It was then seen that after a very short period of training intelligent men originally unskilled could turn out highly-skilled work in greater quantity than had been turned out by skilled men, and that when paid on the basis of output it was again seen that the amount of pay at the week-end depended upon both acquired skill and systematic attention paid to the work in hand.

They were told that building materials were going to be so controlled by Government that only reasonable prices were to be allowed. Those who had had long experience in the purchase and handling of materials in large quantities would be much interested in the new methods of control proposed to be adopted, but it was hardly likely that manufacturers who hitherto had been so well able to look after their own interests and to make a better living than the average by the exercise of brains, energy, foresight, and close attention to the details of their business, would be outdistanced by any gentleman, however clever, who had not a complete grip of the question of production. As, no doubt, ample margins between cost and sale prices of material at present existed, a surer method of control might be the actual production of supplies on a considerable scale at more nearly cost prices. However this might be, they all must admit that the question of a suitable and sanitary dwelling for the lower-paid workmen could not at present be produced without assistance to give a sound financial return, and that therefore there was at present little likelihood of such houses being erected by private builders unless assistance in some form was provided either by the Government or the municipal authorities.

It was one of the wonders of the world that the brick upon brick methods of Bible times should still remain the principal system of producing dwellings for the poorest people, but present conditions were concentrating attention on the subject, and brains and ability were at work on solutions which would ultimately produce organised systems of construction by which building costs could be much reduced.

In moving a hearty vote of thanks to the President of the Section, Mr. H. D. Searles-Wood, F.R.I.B.A., said he was much interested in the views expressed on the subject of higher buildings, and hoped Mr. Brodie would be able to visit London and help to convince people there.

Mr. A. J. Martin, in seconding the vote, said he was very glad to know that the fetish of ten houses to the acre was being attacked; if that principle were applied to Liverpool, with its present population, the city would be spread over 130 square miles.

CONCRETE CONSTRUCTION.

Flat-Slab Construction.

Two papers on concrete construction were then read and discussed together.

Mr. R. Travers Morgan, A.M.Inst.C.E., read a paper on the flat-slab system of reinforced concrete construction, in which the loads are carried direct from the floor-slab to the columns without the intermediary of beams or girders. This method, he said, could justly be described as a true system of construction, in that it in no way resembled the steel-frame or wood-joist methods. In general the construction consisted of a floor slab which was carried directly on to the columns, which had wide conical-shaped capitals where they met the floor slab. In many cases a small portion of the floor slab surrounding the column capitals was increased in thickness, thus forming what was known as the "drop panel." The reinforcement in the slab consisted of bands of small-diameter rods radiating from each column head, the reinforcement in general being situated at the bottom of the slab between the columns and at the top over the columns. The columns were circular in form, and did not differ much, as regarded reinforcing, from those used in the girder or beam type of construction, any difference being at the junction of the column head and slab in the methods employed to overcome tensional stresses between the two.

The advantages of this system were:

(1) There were few edges or corners, and therefore the effects of fire on the construction were greatly diminished, since spalling of edges and corners was materially obviated.

(2) The ceiling being flat, installations, either for sprinkler systems or lighting or otherwise, were made easier and consequently much more efficient.

(3) There being no beams, interruption of light from the windows was entirely eliminated, and the windows might be extended to the ceiling level.

(4) For high buildings a considerable saving in story height was effected, since the question

of beam depth for head room clearance was entirely eliminated.

(5) The time of erection was materially reduced, due to the absence of beams and boxes, and therefore the simplicity of the sheeting required, and also the bending and distribution of the reinforcement.

(6) The cost of construction was also reduced for the reasons given in para. (5).

(7) The absence of corners, and the flat surfaces, tended to better ventilation, cleanliness, and an atmosphere of openness.

(8) Ease of estimating and also quickness.

The lecturer illustrated his remarks by showing photographs and drawings of the Mersey Match Works, completed a year or two ago. Messrs. Mèwes & Davis, FF.R.I.B.A., were the architects, and Mr. S. Bylander the engineer. This building is 540 ft. long by 60 ft. wide by two stories high. The first story is 14 ft. high, split up into bays, 20 ft. by 15 ft. by the columns. The ground story is 20 ft. in height, and is treated similarly to the first. The roof slab is 6 in. thick, being designed for a superimposed load of 1 cwt. per sq. ft., and the first-floor slab, 9 in. thick, for a load of 3 cwt. per sq. ft. The columns in the first and ground story are 21 in. in diameter with the exception of four columns supporting a water tank, installed for the sprinkler system, which are slightly larger.

Upon the completion of the building, a test load was placed upon the first floor. The area loaded consisted of four whole panels surrounding an interior column, the idea being to test a column as well as a panel. As a precaution, the whole of the area of floor tested was strutted, the struts being arranged to give at all times a clearance of one-quarter inch by means of movable fox-wedges. The method of taking measurements was by beam deflectometers under the centre of each panel, together with level readings on to scales fixed to laths suspended from the four panel centres. The measurements taken on the column were by a scale fixed to the column, and read through a level.

In addition to this, a wire was tightly stretched from an arm fastened to the top of the column and with sufficient radius so as to enable the wire to be fastened to the floor outside the area of the footing. Readings were taken every ½ cwt. per sq. ft. of load superimposed; at the same time the propping was adjusted when necessary, and a close observation made of the behaviour of the adjoining construction joints. The results were highly satisfactory, the final load of 4 cwt. per sq. ft. being reached with a maximum slab deflection of ¼ in.

Mr. A. W. Legat, A.M.Inst.C.E., in his paper, said the term "reinforced concrete" was only applicable to combinations of steel and concrete in which each material assisted in resisting the stresses in the structure in the most efficient and economical manner. Structural steel encased in concrete, mass concrete strengthened, perhaps, by old rails and similar forms of construction, were not truly reinforced concrete.

The chief reason for the introduction of steel reinforcement was to resist tension in the members—a stress which concrete itself was not fitted to withstand. It was frequently used in compression members also, for the combined purposes of increasing the compressive resistance, resisting lateral bending, and forming a connection with other parts of the structure. The design of reinforced concrete was founded on the same principles as those applied to other materials, but whilst buildings of steel, stone or timber consisted of many separate members, with joints between, a reinforced concrete structure was monolithic. Whilst this feature was responsible for much of the efficiency and convenience of application of the material to different structures, it did undoubtedly complicate the design, and for this reason practically all details for reinforced concrete structures were elaborated by engineers specialising in such work.

When placing schemes in the hands of designers, it was important to supply full information regarding loads, sub-foundation, clear headroom, column spacing, roof, and floor finishes, provision required for heating, lighting and machinery, etc., in order that the scheme might be detailed to meet all requirements. As a general rule, on receipt of this data the engineer first prepared an outline scheme, drawings, and bills of quantities, leaving the preparation of full calculations and details of the reinforcements until the work matured.

The fire-resisting properties of the material had been clearly demonstrated in numerous conflagrations made, and tests by the Chicago Fire Underwriters' Association were of considerable interest in this connection, showing the very greatly increased resistance to fire of concrete construction.

Concrete itself might be made absolutely waterproof by careful selection of materials, and by thorough mixing and ramming. The joints between different days' work required very special attention, however, but if the concrete surface already laid was thoroughly and conscientiously cleaned off and flushed with cement compo, prior to placing further work, excellent results would be obtained. Failures had occurred in reinforced concrete work, as in other materials, but generally in countries where the standard of design and construction was sometimes not so high as in Britain. The employment of expert engineers to design the work, followed by keen and intelligent supervision of construction, invariably resulted in structures having strength, durability, and economy of construction and maintenance in the highest degree.—A number of slides were shown to illustrate several examples of different types of structure, designed and erected for some of the leading public bodies of the country.

Discussion.

In opening the discussion on these papers, Mr. Brodie said reinforced concrete was being used to a very great extent at the present time, and there was no doubt it was the building material of the future. The only objection to the material was that so far a completely satisfactory finish had not been found.

Mr. Temple said in his opinion reinforced concrete work as carried out was rarely completely monolithic because of the stoppages in the work at meal times and during the night, which prevented the material being poured continuously. It was important to know when the work could be carried out if it would be monolithic or not. In India a great deal of reinforced brickwork was used, as it was found that the native labourers could be relied on to put the reinforcement in properly with that class of work, while they could not always be trained to understand the importance of placing the rods or mesh correctly in concrete.

Mr. Tyler (Auckland) asked if any figures were available giving the relative cost of flat-slab construction compared with column and beam construction. In the case of a very large structure erected in Auckland it was claimed that a saving of £60,000 had been effected by using the flat-slab system.

Mr. Franks (Cardiff) asked what weight or amount of reinforcing steel was used in a typical floor built on the flat-slab system, and whether more or less steel was necessary than in girder construction. On the question of fire resistance, he said some very interesting tests were made in England recently, when a concrete house was destroyed by the fire insurance companies in order to find out the best aggregate from the point of view of fire resistance. It was found in those tests that the most fire-resisting aggregate was old broken brick, and it would be interesting to know what aggregate had been used in the Chicago tests referred to by the lecturer.

Mr. Tyler said the cheapest form of construction for dams up to 60 ft. in height was the slab and buttress type carried on piers. Dams of that type had been built in New Zealand at about 50 per cent. of the cost of the gravity type dam. The multiple-arch dam was more costly in timbering, but was extensively used in America, where they were built as high as 200 ft.

Mr. Brodie said some twenty-five years ago he built a concrete roof, exposed to the weather, with a thickness of only 5 in. and reinforced with hoop-iron. When it was required to remove the roof recently it was found impossible to break it up without the use of sledge-hammers, and it was found that the whole of the reinforcement was as bright as when it was put in—ample proof that concrete could be made weatherproof. There was no doubt that, in view of the shortage of bricks, concrete would have to be very largely used in housing schemes as well as for other work. He had seen concrete with a glazed surface which looked very well, but he understood that the particular method of glazing which he had seen did not weather very well. It was a matter of great importance now concrete was being so extensively used that a satisfactory and cheap method of providing an attractive surface finish should be found.

In reply to the points raised in the discussion, Mr. Morgan said he thought there were only three buildings in England erected on the flat-slab system. The difference in cost between the two methods of design was about 20 per cent. in favour of the flat-slab system. The percentage of reinforcing steel in flat-slab construction was about 0.675. With regard to surface treatment, so far engineers had concentrated more on utility buildings, but now concrete was being used for monumental buildings he had no doubt that, with the increased attention being given to the subject, a suitable and inexpensive method of surface finish would soon be discovered.

Mr. Legat said if the positions where the joints at the end of each day's work were to come were specified by the engineer so that they would come where expansion joints were needed, a complete monolithic structure would be obtained. A point often overlooked, with serious results, in concrete construction was the position of the plant, which should be placed in such a position that there was a minimum of vibration on the structure while the concrete was setting. In regard to the flat-slab system, it had to be pointed out that this method could not be carried out at present in districts which strictly adhered to the provisions of the London County Council Regulations for Reinforced Concrete. He did not know what aggregate was used in the Chicago fire tests, but there was no doubt that the most fire-resisting material for the purpose was thoroughly clean and well-burnt broken brick; the next best material from that point of view was rock which had been fired in the course of its formation.

Land for Housing.

Mr. J. D. Wallis, Official Arbitrator under the Acquisition of Land (Assessment of Compensation) Act, 1919, has issued his award in a claim by Lord Egerton of Tatton against the Corporation of Manchester, concerning the Corporation's compulsory acquisition, for housing purposes, of land, buildings, and hereditaments, containing an area of about 76¾ acres.

The Arbitrator has awarded that the acquiring authority is to pay to the owners the sum of £25,986 as purchase money and compensation and interest at the rate of 5 per cent. per annum from the date of entry until payment of the compensation. The acquiring authority is to pay the fees on the award, and £200 towards the owner's costs. The award is subject to certain conditions which were agreed between the parties.

At the hearing of the claim, Mr. John Herbert Hall, chartered surveyor, on behalf of the claimant, submitted a valuation of £34,738. On behalf of the Corporation, Mr. Joshua Burton, chartered surveyor, submitted a valuation of £23,090.

PROGRESS OF THE HOUSING BILL

The Committee stage of Mr. Wheatley's ousing (Financial Provisions) Bill was begun the House of Commons on July 16.

Clause 1 provides that sections 1 and 2 of the ousing Act of 1923 (relating to contributions the Minister of Health to the expenses of al authorities in assisting the construction houses) shall extend to houses completed fore October 1, 1939.

Sir T. Inskip moved an amendment to leave ut this date, on the ground that 15 years was o long a time for the pledge given by Parlia- ent to continue.

Mr. Wheatley refused to accept the amend- ent, stating that the 15-year period was part his agreement with the building industry d would be the first step towards stabilising at industry.

Sir Wm. Joynson-Hicks said the building ade wanted to know where it stood. If ilders were to put up new works, start new ickfields, and the manufacture of various ticles for building they wanted continuity. e denied that there was any continuity hatever under the Bill.

Sir P. Hastings (Attorney-General) said the arantee to the building trade was the finest Minister had ever offered, and it was the only ssible one. The Minister had gone to the ilding trade and had said, "You provide the uses and we will see that the contributions e given. All you have to do is to give the uses you have undertaken to give. We then arantee that you shall get the money."

Sir P. Pilditch said the only party bound that bargain was the State.

Mr. Sunlight suggested that, instead of the arantee being given for 15 years, it should be three years, to be renewed every three years oviding the building trade carried out their rt of the bargain.

The amendment was rejected by 255 votes 154.

Mr. Wheatley undertook to endeavour to et, on the report stage, the object of an ıendment to provide that no proposal for the ovision of 25 or more houses should be ıctioned until the Minister was satisfied that would not be prejudicial to any town-planning ıeme.

On the question that Clause 1 be agreed to, e size of the houses for which the subsidy is be given came up for discussion. Mr. nlight expressed himself in entire agreement th the Minister in holding on to the 950 ft. uit, because he had to cater for people who uld not afford large houses, but as a com- omise the smaller subsidy of £75 permitted der the Bill should apply to houses of 1,050 ft., as to differentiate between the larger and aller subsidies in respect to area.

Mr. Wheatley explained that there was thing to prevent the matter from being ised when they were considering the subsidy rms in 1927. They would do very well if they ilt between now and 1927 all the 950 ft. uses which would be erected if there was maximum at all.

Clause 1 was agreed to.

The Committee then considered clause 2, ich increases the subsidy from £6 a year 20 years, to £9 a year for 40 years (£12 10s. the case of an "agricultural parish").

Mr. Franklin moved an amendment to enable sons who were prepared to provide houses to so and to offer them to the local authority, o. although they had not initiated the putting of these houses by the giving out of the con- cts, would be able to purchase them.

Mr. Sunlight supported the amendment, ch, he said, empowered the local authorities purchase from the speculative builder. This uld help to keep down the cost of houses would give the speculative builder and ate enterprise a chance. Many professional , in the absence of work in their own profes- , would be quite ready to begin to build in nall way—say, a dozen cottages—provided could be assured that the local authority would be likely to take them over at a competitive price.

Mr. Wheatley refused at first to accept the amendment, but, on being pressed to encourage small builders, he agreed to draft some suitable words in order to carry out the object of the amendment and yet at the same time protect the locality from injury by intrusion into local schemes. On this understanding the amendment was withdrawn.

An amendment was moved by Mr. N. Chamberlain to provide that where a reduction in the subsidy could be made without imposing any burden on the local rate such reduction should be made to the extent that was possible. He pointed out it was possible that some new method of construction or material might greatly reduce the cost of houses, and this contingency had not been provided for.

Mr. D. G. Somerville supported the amendment.

Mr. Sunlight also supported the amendment, expressing astonishment that the Minister had not offered some premium for the purpose of designing new forms of construction which would bring down the cost.

Lord Wolmer said in time cheaper methods of construction would be found, and he had been assured that there was at the present moment a company which was prepared to bring out concrete-built houses which were a great improvement on any previous concrete houses. Such a method would mean that houses could be built for about £250 to £300 each.

Mr. Wheatley declined to accept the amendment, although he said he welcomed any good methods of providing houses. The amendment was defeated by 245 to 122.

Later, Mr. Wheatley accepted an amendment to enable a parish to be classed as "agricultural" (thus qualifying for the £12 10s. subsidy) if the population is less than 50 persons per 100 acres. The Minister also undertook, on report, to insert a new clause providing that in an agricultural parish no more than eight houses to the acre and in an urban district not more than twelve to the acre should be built without the consent of the Minister.

Mrs. Wintringham moved an amendment to provide that outside extensions of rural houses shall not be reckoned as part of the 950 ft. which are the limit for the size of the house. She said in country districts it was important that there should be a place where a workman could put his tools, bicycle, &c.

The Attorney-General said under the rules of the 1923 Act, which met the difficulty, tool sheds and bicycle sheds were not included in the measurement of the house.

Mr. D. G. Somerville inquired whether a garage would come under the subsidy.—The Attorney-General replied that he did not think the man who was paying only 5s. or 6s. a week rent was going to concern himself about a garage.

The amendment was negatived, and shortly afterwards the House adjourned.

On the following day discussion was begun on Clause 3, which sets forth that houses provided by a local authority shall be deemed to be subject to special conditions if the local authority undertakes in such manner as the Minister may require that certain conditions (set out in the clause) will be complied with in relation to the houses.

Mr. H. Johnstone moved an amendment to enable materials required for the construction of houses to be purchased in the cheapest market, wherever situate. Mr. Wheatley expressed sympathy with the object of the amendment, but said he would accept later a new clause embodying the object desired, and the amendment was therefore withdrawn.

Mr. Wheatley, on another amendment, agreed, on the report stage, to put down words which would give facilities for the sale of houses on terms that would not be better financially than if an occupier had purchased his house as he would purchase it now under the Act of 1923. He had no objection, he said, to the occupier of a house becoming the owner.

Mr. Vivian moved an amendment to ensure that the cost of building the houses under the Bill shall not exceed 10s. 6d. per ft. super. of contained area, unless otherwise provided for by the Minister. He said 10s. 6d. per ft. super. for a 950 ft. house was £498.

Mr. Wheatley, while agreeing with the object of the amendment, said he feared it would defeat the desire to keep down prices. If the building industry were properly organised—as it now had an opportunity of organising itself—it should be possible to build these houses for substantially less than £500 each.

The amendment was negatived by 236 votes to 111.

Mr. Sunlight moved a new sub-section to provide that the dimensions of all bricks used in building houses under the Bill should be 9 in. × 4½ in. × 3⅛ in. in size. He urged the standardisation of bricks on the ground of economy, and said before the war architects had a clause in their specifications that certain things, such as bricks, timber, &c., should be of a certain size. During the war, however, brickmakers not only raised the cost of bricks per thousand, but reduced the size from 4½ in. wide to 4¼, and from 3⅛ to 2¾ in. thick, so that the cost, both in material and labour, was increased. As soon as the present Bill became law and contracts were given out, brick-makers might attempt to reduce the size of bricks.

Mr. Wheatley said the amendment was unworkable, and he could see nothing in its merits which would justify making such a revolutionary interference with private business.

The amendment was negatived.

The House adjourned further discussion on the Bill until Monday.

During the concluding stages of the Bill, on Monday, a statement was made by Mr. Wheatley on an amendment to Clause 4 (which deals with the termination of the Government's liability to make contributions under the Bill), moved by Sir G. McCrae, to insert words to give the Government power to withhold contributions in the absence of adequate arrangements for the necessary increase in the supply of labour and materials at reasonable prices.

Mr. Wheatley, in reply, did not question the statement that they had not got an adequate supply of men and materials to ensure the desired number of houses. He intended to take steps, immediately the Bill went through, to make the apprentice bricklayer a more effective bricklayer than he usually was by the ordinary process of training. He intended to make an appeal for the co-operation of the educational authorities in this respect. They ought to have the very best class of training for their apprentices, and that training should be given in a manner which would enable them to get an output from the apprentices in the shortest possible time. In some schemes in the country already the employer had granted facilities for apprentices to attend training centres during two half-days a week. That had had very satisfactory results, and he intended to introduce a scheme as far as possible to make that general. Such training would be given largely in the local technical schools, but largely, he hoped, without much expenditure, on the actual job, where the services of highly skilled teachers were on the spot where the apprentice went to work, and where they would train him as rapidly as possible in the craft for which he was intended. He had not had an opportunity of submitting that to the National Building Committee, or to those who were likely to deal with it, but the men's leaders had assured him they would cheerfully co-operate. He had no doubt the employers would grant the necessary facilities, and he was very hopeful it might be possible that the apprentices who had received this special instruction would be passed, by a test, more rapidly into the industry than they would be if they had not had this practical assistance.

Dealing with new methods of building, Mr. Wheatley said that he was going to inspect a system of building houses largely of steel and timber, which had been invented by an eminent

business man, who had a great reputation in the business world. In the past few days he had had submitted to him a new material for house-building, which it was claimed would give more substantial and more beautiful houses in a tithe of the time now occupied in building, and which would give the houses more cheaply, and without the services of bricklayers or plasterers. He had no technical or scientific knowledge to enable him to pass judgment on the value of the material, but it seemed quite promising. If it succeeded, the building industry would still require to recruit its personnel, but instead of taking in bricklayers, plasterers and carpenters, men would be engaged to manufacture the new building material. To meet Sir G. Macrae's amendment, he proposed to add words on the Report stage to enable the Government to withdraw their contribution if the deficiency of houses was "due to the absence of adequate arrangements for the necessary increase in the supply of building labour (including any necessary augmentation of the number of apprentices employed), or for the necessary increase in the supply of materials at reasonable prices, or from any other cause."

Sir G. Macrae's amendment was accordingly withdrawn.

Mr. Wheatley moved a new clause to give the benefit of the "Chamberlain" subsidy to private persons in areas where local authorities had failed to put into operation either the "Chamberlain" Act or this Bill. Sir Charles Starmer moved to make the clause restrospective, but this was resisted by Mr. Wheatley. On this point the Government was defeated by 201 votes to 155—an adverse majority of 46.

Later in the sitting the Government was again defeated, this time on an amendment, moved by Mr. Paley, a Labour member, to provide that where employers build houses for their workpeople and these workpeople cease to be employed, the tenants shall not be evicted. Mr. Wheatley supported the amendment, which was rejected by 137 votes to 119.

After various minor concessions, the Committee stage was concluded at 2.28 on Tuesday morning, and the Bill, as amended, was reported to the House.

Constructional Glass at Wembley.

The British Empire Exhibition is entirely glazed, lit and protected with British glass.

Obviously, in an undertaking so large as Wembley, in which are scores of differently situated buildings, almost every kind of glass—polished plate glass, sheet, rough rolled, wired, and cathedral—has been used. Outside, the eight hundred round opal lamps, which light the avenues, are all glazed entirely with British flashed opal glass. Past the Burmese Temple is Old London Bridge, whose mullioned shops flaunt the old-fashioned bulls-eye glass of two centuries ago. But, actually, the glass is new for it was made only a few months ago at St. Helens. The stand of the two glass makers who supplied the Exhibition—Messrs. Pilkington Bros., Ltd., St. Helens, and Messrs. Chance Bros. & Co., Ltd.—is almost in the centre of the Palace of Industry. Messrs. Chance Bros., manufacturers of optical glass, are the only British makers of ordinary spectacle glass, and also of Chance's Crookes glass for protecting the eyes against glare and strain.

"Calorex" roofing glass is shown, with old English "Crown" microscopical cover glass and heat-resisting globes and chimneys. There is also a model of two factory buildings, one overshadowing the other, showing the difference in lighting made by prismatic glazing. The actual piece of glass used is not more than 6 in. square. The most noteworthy exhibit of Messrs. Pilkington's, perhaps, is not to be seen at the stand, but in the Palace of Engineering. At the Watt Gate Entrance stands a mammoth plate of glass (336 sq. ft.). This is stated to be the biggest piece of plate glass in the world, and weighs 1,700 lb.

ARCHITECTS' AND BUILDERS' INQUIRY BUREAU

**** *We are glad to give questions and answers but cannot accept responsibility for contributed replies, especially on legal matters.*

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or better still, in typescript?—ED.

Sand-Lime Bricks.

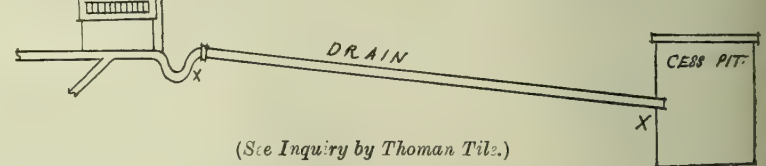
[REPLY TO D. B. H.]

SIR,—The Special Report No. 1 of the Building Research Board on "Sand-lime and other Concrete Bricks," price 3d., will probably give D. B. H. the information he requires. "S."

SIR,—Your correspondent who inquires *re* sand-lime bricks in your last issue will find what he wants in Special Report No. 1 ("Sand-Lime and other Concrete Bricks," by H. O. Weller, B.Sc., M.Inst.C.E.) of the Building Research Board (Department of Scientific and Industrial Research). 1921. Price 3d. net; to be obtained at H.M. Stationery Office, Imperial House, Kingsway.

MANNING ROBERTSON.

Insulating.



[REPLY TO "L. X."]

SIR,—Your correspondent, writing on the above subject, states (by what authority or on what grounds I do not know) that where a cavity wall is used for insulating purposes the cavity should be sealed so that a stagnant cushion of air is formed that is non-conducting. Surely it must be well known by now that it is well-nigh impossible to enclose "a stagnant cushion of air"? In a sealed cavity wall the air will always be liable to circulate through changes in its density brought about by variation in temperature between the enclosing walls, and as soon as circulation commences the insulation is seriously impaired.

"H. N. I."

Drainage.

SIR,—Would you kindly give me your opinion on the enclosed sketch? It is the present drainage system in a rural district to a small house. The cesspit gets full and overflows, causing a nuisance. The Rural District Council has ordered me to remove the intercepting

(*See Inquiry by Thoman Tile.*)

trap to the lowest end of drain and provide and fix an airtight cover to the inspection chamber. If this is done, there will be no fresh air in the pipes, and, as the cesspit gets full, the sewage will back-pound up the drains, which will be full of sewage. THOMAS TILE.

Cowhouse Floors.

SIR,—In answer to "Agricultural," the best floor for a cowhouse is composed of cement and granite chippings. This should be properly laid, sloping to a wide and shallow channel, wide enough to get a shovel in for cleaning. The floor should be grooved where necessary to prevent slipping, but the grooving should be arranged to allow water to run clear away. There should be a sloping piece between the cows and the channel so that solids do not block the channel. The floor should be rounded near the walls, and a cement dado carried up the walls high enough to prevent any soiling, the dado being washed down every day when the floor is cleaned. All channels should deliver on to a gulley outside the cowhouse, and the drains, which should be ventilated, should empty into a manure tank.

T. NOBLE REAVELL.

Leytonstone.

SIR,—The information asked for is rather too large for a reply through *The Builder*. I have made a study of this question and designed many modern cowhouses and agricultural buildings. If "Agricultural" cares to send his name and address to me through *The Builder*, I will gladly send him a tracing of plans of a model cowhouse. E. J.

SIR,—Your correspondent "Agricultural" will find all the information *re* cow houses he wants in leaflet No. 241, issued by the Board of Agriculture. H. L. WRIGLEY.

Ceiling Lining.

SIR,—We have an enquiry from a local architect for material for lining the ceiling of the hottest room in a Turkish bath. He wants something like porcelain-enamelled steel that will stand intense hot air, permanent faced, easily cleaned, must not lose its white colour, and to fix on joints or equal of lathing and plaster. P. W. A.

21 Oz. Glass.

[REPLY TO M. T.]

SIR,—The present price of 15 oz. sheet glass, fourths quality, is 3⅜d. per ft. super, and that of 21 oz. sheet, thirds quality, is 6¼d. per ft. super.

Your correspondent does not tell us what size house he has in mind, or what type or size of window, or how many of them, but I hope these figures will be sufficient for him to arrive at the information he requires. "Z."

Treatment of New Walls.

[REPLY TO A. G.]

SIR,—In response to your correspondent, "A. G." (*The Builder*, July 7), who inquires for what period new walls (which have not had time to dry out and the surfaces have been treated to lime putty finish) should be left before it can be taken that drying is complete, and that the soda, &c., has worked out, I am very pleased to be able to inform him that after repeated, length and exhaustive trials on a large and practica scale, if two thin coats of "primeroid" b applied to the walls in question and each coa allowed to dry out thoroughly (which take five to seven days), one can follow on as soon a the "primeroid" is dry.

M. A. (Cantab.).

SIR,—The period required for new lim plastering to dry out sufficiently for decoratio to stand thereon well, depends upon the weathe if the house is occupied or not; and if fires o other heat is provided in the rooms, and vent lation maintained. Generally a good averag period of twelve months will be found to b long enough unless circumstances are ver adverse. "L. T."

THE BUILDING TRADE

OME REFLECTIONS ON HE BUILDING TRADES DISPUTE

By W. H. STOKER, K.C.

"The resulting issue has been productive f much misunderstanding between the parties. Recognition by each side of the fact that their osition has not been understood by the other, he settlement of the Liverpool difficulty, and he resumption of negotiation appear to be he only means by which the dispute can be rought to a speedy end and good will re-tored in an industry of national importance nd owing great responsibilities to all classes f the public."

The above extract from the conclusions set ut in the Report of the recent Court of In-uiry presided over by Lord Buckmaster oints a moral. Rather more than a year go the writer, in the course of some articles ontributed to *The Builder*,* expressed the ope that means might be found of resus-tating the Building Trades Parliament, eally the Joint Industrial Council for the uilding industry. The Parliament had be-ome practically defunct owing to the seces-on therefrom in May, 1922, of the National ederation of Employers. This secession came st a year after the formation of the National Vages and Conditions Council, created to deal olely with wages and conditions of employ-ent. There can be little doubt that the xistence of this Council contributed to the ithdrawal of the National Federation of Em-oyers from the Building Trades Parliament. Vhatever were the real causes, the effect was at employers and operatives only met ationally to consider wages and conditions of mployment—that is to say, on the National Vages and Conditions Council—and no com-on meeting ground remained for the con-deration nationally of the general mutual ncerns of the building trade.

Lord Askwith, writing to *The Times* on arch 16, 1923, urged that each industry ould deal with its own unemployment, and at Joint Industrial Councils should devote tention to that subject; but he also drew tention to what he conceived to be the true nctions of the Industrial Councils, and precated their being regarded as committees ncerned only with the regulation of wages. ecognising the danger of this, the Building rades Parliament had entirely excluded from sphere the regulation of wages, this being ft to the Conciliation Boards previously tablished. It concerned itself with the mmon and mutual interests of the industry. Then the National Wages and Conditions ouncil was set up, it did not interfere, except so far as it settled wages and conditions of mployment, with the Conciliation Boards. hese continued to adjust questions and dis-tes other than those coming within the pur-ew of the National Wages and Conditions uncil. It will be seen, therefore, that the sition resulting from the formation of the tional Wages and Conditions Council and secession of the employers from the Build-Trades Parliament is that although there ll exists, in the shape of local Conciliation ards, machinery for settling disputes, other n wages and conditions, there are no oppor-nities for the national interchange of views l mutual discussion of matters of common erest.

This fact cannot but have weakened the ds of union between employers and em-yed, and the sequel is now seen in the sent position, as described in the extract ted above from the conclusions of the Buck-ster Court of Inquiry. Opportunities for fostering good will and the understanding by each side of the other is absent. The parties are in opposite camps and suspicion of motives is rife. Employers and operatives alike become prone to think and act parochially, and a general break-away ensues from national settlements and negotiations.

One of the many subjects appropriate for the consideration of the Building Trades Parliament, as a Joint Industrial Council, is that of an apprenticeship scheme ensuring the supply of skilled bricklayers and other skilled operatives. The shortage of these is now seriously affecting the erection of houses. Another is the regularisation of demand and the decasualisation of labour. This was one of the subjects taken up by the Building Trades Parliament, as a possible solution of the fear of unemployment. Progress with all these subjects was stopped on the withdrawal of the Employers' Federation from the Parliament. The causes leading to withdrawal were referred to by the writer in the previous articles set out in the footnote, and it is to be hoped that employers and operatives alike may at this juncture consider whether they cannot bridge over the difficulties in the way of re-establishing a National Council to consider and discuss matters of mutual interest and concern apart from wages questions, as contributing also to peace and good will in the more controversial side of their relations.

*March 30th, April 27th, and May 11th, 1923, Affiliation, Wages-Adjustments and Whitleyism in the Building Trades.

WORKMEN'S COMPENSATION

A recent case, Evans *v.* Postmaster-General (*The Times*, July 17), again raised the point, When does a workman's contract commence, so that in case of accident he can claim compensation as "arising in the course of" the employment?

The facts of the case are simple. The man was a postman, and while on duty he was permitted to use a bicycle; he was also allowed when one day's duty was finished to take the keys of the letter boxes home with him to save time. On the day of the accident, his first duty would be to go to a pillar box about three miles from his home, and clear it at 4 p.m. His hours of work were forty-eight hours a week, and the time taken to reach his first point of duty was not included. On the day in question, whilst riding from his home to this first pillar box, in uniform and with his bag and the keys, he met with a street accident at 3.40, which caused his death.

The County Court Judge had held that the applicant, the man's widow, could only succeed if she could show that it was an implied term of the contract of employment that it should commence when the man left his own door on the bicycle, and as this could not be shown, he held that the accident did not arise "in the course of" the employment. The Court of Appeal held that there was abundant evidence to support the finding of the County Court judge, and, therefore, the appeal must be dismissed. No cases are cited in the report, but the case appears to come within the principles which were laid down by the House of Lords in St. Helen's Colliery *v.* Hewitson (1924, A.C. 59), which we discussed in our issue for April 25 last.

In that case the men were not paid for the time occupied in travelling to their place of work, but a means of access was provided by train at a reduced fare. The use of this means of access was optional, and there were other means of access, but a man using this means of access and killed whilst in the train was held not to have been killed whilst acting "in the course of" the employment. The report of the case we are considering does not state whether the man was using a bicycle provided for him by the Post Office, or his own bicycle, but in either case the principle laid down by the House of Lords seems to apply that a mere right, apart from obligation, to use a particular means of access does not bring the man within his contract of employment.

In the case under consideration, it was not argued whether the accident arose "out of the employment," for it was admitted that if it arose "in the course of" the employment it would also arise "out of" it.

THE MANUFACTURE OF BRICKS

Bricks were the subject of an address given by Mr. S. B. Stedham recently to the members of the Plymouth Rotary Club. Mr. Stedham said brickmaking as an art was very ancient. Bricks were used in Egypt 12,000 years ago, and some discovered in Abyssinia were over 6,000 years old. Those early bricks were made with mud from the Nile mixed with straw. The Romans introduced bricks into England in the fifth century, and the earliest known example of their work was to be seen in Colchester Abbey. Probably the earliest brick building in this country—of a composite character—was in Suffolk and was built in 1260. Bricks were not found to be a necessity in this country until the thirteenth or fourteenth century, because there was plenty of wood in the forests for the construction of houses, and it was not until after the Great Fire of London in 1666 that they were generally used in place of wood, which had proved so disastrous a material. It was only about 85 years ago that the old style of brick-making by hand was superseded by manufacture by machinery. Dealing with the colour of bricks, Mr. Stedham said that in America and Canada to-day they were being turned out in all sorts of hues—blue, green, brown, yellow, purple, black, chocolate and red—and when they were mixed together in the construction of a house they gave it a very variegated appearance. Within the next 25 years be believed there would be long stretches of roads in England paved with bricks. Several trial lengths of brick paving had already been laid in Nelson (Lancashire), Keighley (Yorkshire), and in North Wales; others were in contemplation. In America it had been proved that there was no road paving material which would stand modern traction like bricks on a good foundation. Bricks were dustless and non-slipping, and the energy required to draw a load over them was one-half of that needed to draw an equal load over granite setts. The only drawback was the initial cost, which was 25 per cent. more than an asphalt road, but its life was much greater and the cost of upkeep very low, so that over a number of years brick paving was much cheaper than other forms of paving. In a city in Ohio, a brick road had been relaid after 25 years' use by simply turning the bricks over.

Mr. Stedham said an erroneous impression was abroad that the present price of bricks was responsible to some extent for the existing high housing costs, but as a matter of fact bricks represented about one-sixth of the total cost of the material of a £500 house, so that a few shillings one way or the other in their price made very little difference. There was no other manufactured article on the market which had to go through so many processes and yet was sold at less than 25s. per ton. Considering the tremendous amount of handling and the cost of coal, clay, oil and other items necessary in the manufacture, the marvel was that bricks should cost as little as they did to-day. In conclusion, Mr. Stedham contended that there was no material used in building which looked more artistic than bricks, and pointed out that they had the added advantage of improving with age.

THE HOUSING BILL IN COMMITTEE

The Housing Bill entered the Committee stage on July 16.

An amendment was moved to clause 1 in relation to the date fixed for completion of houses within the Bill, that is, October 1, 1939. The amendment was defeated, and it seems fairly obvious that if, as the amendment proposed, the date were deleted altogether the scheme of subsidies would continue for ever, but in the course of the discussion many important points were raised in connection with the action of local authorities and the so-called agreement with the building trade, but no fresh information appears to have been obtained on these points. The point of most importance appears to have been that the Minister of Health has conceded that the local authorities should have full power to fix the number of houses they will build in any period and a discretion to suspend building operations for any reason at any time, and that this is inconsistent with any fixed guarantee to the building trade that the Bill shall operate for 15 years.

We have already drawn attention to this point in connection with the powers given by the Bill to cease contributions under clause 4. In the discussion in the Committee it appears to have been asked whether if the local authorities failed to build under the Bill the Government could, and would, itself act as was provided under the Act of 1919. The Attorney-General stated that if the local authorities refused to build the only way to deal with them would be by fresh legislation, whereas Mr. Wheatley declared that the powers to supersede them still existed under the Act of 1919. No declaration of policy, however, was made, and the guarantee seems as precarious as ever. If the local authorities do not act the Government can in about three years withdraw subsidies; thus the guarantee amounts to a period of 3 years, and not 15, as stated in clause 1. Even if the powers still exist for the Government to step in and act for the local authorities, which is a question of law which can hardly be definitely answered until this Bill takes its final form, it is hardly likely that any Government would dare to supersede local self government on such a large scale in matters imposing such heavy charges on the rates over a prolonged period. Thus the guarantee to the building trade remains somewhat nebulous.

The next amendment, moved by Lieut.-Col. Fremantle, received sympathetic attention from the Minister. It proposed that no project for the provision of more than 25 houses should be sanctioned unless the Minister was satisfied it would not be prejudicial to any town-planning scheme. The Minister pointed out that the difficulty was that town-planning schemes need not be formulated until 1929, but he undertook to draw the attention of the local authorities to "the tremendous importance" of the object underlying the amendment and to the need in the rebuilding of a large part of the country of particular care in order to see that the lay-out would be creditable to the country, and said that if he could find any words which would carry out the object in view on the Report stage he would add them.

On clause 2 a very important amendment was moved by Mr. Franklin, as it has some bearing on the retention of private enterprise in connection with the Bill. The object of the amendment was to empower a local authority which did not itself provide houses to purchase houses completed after the passing of the Bill, and it was pointed out in the course of the discussion that the small builder could produce houses cheaper than the local authorities may be able to. The Minister, we are glad to say, consented to consider this matter, and at a later stage to produce a clause dealing with it.

An amendment moved by Mr. Comyns Carr to enable local authorities to call in the aid of building societies and guarantee to them the payment of the whole or part of the instalment due to the person who built or acquired the house also received sympathetic consideration from the Minister, who undertook to consider it on the Report stage.

Some amendments were promised as to the definition of agricultural parishes, and limiting the number of houses to the acre to 8 in agricultural parishes and to 12 in urban districts, unless the Minister consents otherwise. Consideration was also promised to be given to an amendment enabling a private person, living in a district where the local authority refused to apply the Bill, to obtain the subsidy.

The Attorney-General moved an amendment to include houses commenced or contracted for before the passing of the Bill, and an amendment moved by Mr. Snell was accepted relating to houses built under special conditions by a Metropolitan Borough Council enabling the London County Council to supplement any contribution made by the Minister to an extent not exceeding £2 5s. payable annually for a period not exceeding 40 years.

This represented one day's work in Committee, and we refer to this as showing how superior is the Committee of the whole House to other Committees.

At the second day's sitting an amendment was moved to clause 3 subclause (1) (*b*), which relates to subletting with the leave of the local authority, suggesting that this license, like that in ordinary leases, should not "unreasonably be withheld." The Minister promised in the Report stage to see that tenants were not prevented from taking in lodgers. We may point out that this taking in of lodgers is one of really great importance, as it lies at the very root of good housing conditions. The nation is taking the greatest pains to secure that the population shall be suitably housed in sanitary conditions, but often when houses are provided they are at once overcrowded in order that the tenants may pay their rent by taking in lodgers. Where a large State and local subsidy is being given towards the rent of houses it does not seem unreasonable that the local authority shall have a voice in the number of persons who shall occupy subsidised houses, and it is to be hoped that some control may be exercised in this direction and that the overcrowding and exploitation which has become connected with rent-restricted houses may not be repeated in the case of this vast scheme of houses subsidised as to rent.

A very important amendment was promised by the Minister to clause 3 subclause (1) (*c*), which should give facilities for the sale of houses by the local authorities on terms not better financially than if the occupier had purchased his house as he would purchase it now under the Act of 1923. We certainly welcome this concession, as we believe in allowing any man who so desires to own his own house, and we deprecated the terms of the Bill which would nationalise the holding of working-class dwellings. The terms of the new clause will be a matter for later consideration.

On the motion of Mr. Greenwood an amendment was agreed to that a fair-wages clause which complies with the requirements of any resolution of the House of Commons applicable to contracts of Government departments should be inserted in contracts for the building of houses under the Bill. An amendment to prevent inflation of building costs by fixing that the cost shall not exceed 10s. 6d. per ft. super of contained area unless otherwise provided by an order of the Minister, was not carried, but the Minister declared that whilst he was at the Ministry he would not pass schemes if prices went up.

An amendment relating to clause 3 subclause (1) (*e*), providing that the rents charged for the houses built under the Bill should not exceed the rents generally paid for the time being in the area of the local authorities for houses of similar size, type and amenity, was not carried, but the discussion showed that the same inequalities and preferences would result under the Bill as have been experienced in connection with rent restriction. Restricting rents and subsidising rents must inevitably produce such results, and it would almost appear that the well-tried system of economic rents has disappeared for ever with the inevitable further result of disturbing rating principles.

The House made excellent progress in two days in disposing of the greater part of three out of the nine clauses of the Bill, and some useful amendments have been accepted, but this will not suffice to get rid of the many inherent defects in this measure, which still appears to us impracticable, being too vast in its proportions and extending over too long a period, besides involving much too heavy expenditure of State and local funds, and the fear is that it may prove but a huge air balloon floating over the heads of the electors. Although the problem is vast, and less ambitious measures have not sufficed entirely to solve it, even Rome was not built in a day, and we should have preferred to see an attempt made to extend and amend existing legislation.

BUILDING EDUCATION

On Monday there opened in London the sixth of the series of short full-time courses for teachers of building subjects which has been arranged in recent years by the Board of Education. As in previous years a full and interesting programme has been arranged, and, as is fitting this year, when so many important conferences are taking place in London, the programme for this course is marked by a number of special features. The scope of the lectures has been considerably enlarged, so as to make it possible to include a number of topics of peculiar interest, particularly when considered in connection with the developments now taking place in the organisation of builders' work, and in the more thorough application of scientific knowledge to the technical problems of the building industry.

We understand that there has been a record number of applications from building teachers in technical schools to attend this course; over eighty of these have been selected to attend, again a record number. The course will extend from July 21 to August 2. The teachers in attendance will be divided into five groups, each group taking a different subject in each week. During the first week, Mr. T. P. Bennett, F.R.I.B.A., will deal with the subject of building design and planning; the subject of advanced mathematics and geometry for building students will be dealt with by Mr. F. E. Drury; Mr. A. Everett will deal with the introductory physics and chemistry of building science; while Mr. A. E. Holbrow, A.R.I.B.A., will take the subject of surveying for builders. During the second week, Mr. J. H. Barns and Mr. Leonard Lickis will deal with the subjects of builders' quantities and builders' estimates; Dr. R. E. Stradling with the experimental investigation of building materials; Mr. F. E. Drury with reinforced concrete; and Mr. L. Allen Gerrard will introduce the subject of building practice and organisation.

For the first time in the history of these teachers' lectures a course has been arranged for teachers of painting and decorating. This course will extend over the whole fortnight and, by the kindness of the London County Council, will be held at the L.C.C. School of Building, Brixton. The lecturers are Mr. H. Davis Richter, R.O.I., and Mr. A. R. H. Jackson, A.R.C.A.; while the craft instructor will be Mr. Leonard Drinkwater.

During the whole of the period the mornings will be given up to lectures and tutorial work. The afternoons and some of the evenings will be occupied by specialist lectures, by discussions on teaching methods, by visits to important works and research laboratories, and by conferences with various bodies. Conferences have been arranged with the Royal Institute of British Architects, the Institute of Builders the Institute of British Decorators, the National Joint Education Committee of the Painters and Decorators, and the National Federation o

Building Trades Operatives. During the first week, the teachers attending the course will be received at Whitehall by the President of the Board of Education.

For the third time in succession the teachers will be housed and most of the lectures will be given at the Westminster Training College, the whole of the accommodation in these buildings having been generously placed at the disposal of the Board by the authorities of the College. The opportunities which this short period of collegiate life gives to the teachers for the discussion of their problems with each other and for association with the genial and popular Principal of the College (the Rev. Dr. H. B. Workman, D.D.), form a not unimportant part of this attractive and useful course.

BUILDERS' BENEVOLENT INSTITUTION

THE annnual general meeting of the donors and subscribers of the Builders' Benevolent Institution was held on Tuesday at 48, Bedford-square, W.C.1, when the chair was taken by Mr. George M. Burt. President.

The minutes of the last meeting were read and confirmed.

The seventy-seventh annual report was presented, from which it was seen that the generous response to the appeal of the President had enabled the Committee again to grant gifts to pensioners at Christmas and Midsummer. The number of annual subscriptions had been increased and the year's working showed very satisfactory results.—The report was adopted.

Mr. George Perry Nash (Messrs. Hall, Beddall & Co., Ltd.) was elected President for the ensuing year.

Alterations in Rules I and III, whereby the Committee would be enabled to increase the amount of benefit in special cases, were proposed by Mr. G. M. Burt, seconded by Mr. G. J. Aldous, and carried.

The following were re-elected:—Hon. Treasurer, Mr. Frank May; Hon. Auditors, Messrs. Hubert S. Ward, F.C.A., and John T. Bolding. Committee: Messrs. G. J. Aldous, B. Hannen, G. R. Holland, H. T. Holloway, Sir Walter Lawrence, Messrs. J. W. Lorden, F. A. Minter, G. P. Nash, J. C. Nicholson, and Sir Frederick Rice.

Major Holliday proposed a vote of thanks to the retiring President, which was seconded by Mr. Bolding and carried unanimously.

Fort Dunlop.

Two million bricks have been used for the store building approaching completion at Fort Dunlop. It contains 36 tons of lead, 4,200 tons of steel, 4,800 tons of cement, 5,700 tons of sand and 20,000 tons of gravel for concrete. The concrete takes up 13,000 cubic yards in the floors and walls, and there are 16,500 ft. of Bath stone. The windows hold 42,000 ft. of glass, the roof 7,400 yards. On each of the floors there are metal racks on which to stack the tyres for which the building is intended. The building has two five-ton lifts, equal in power and capacity to the passenger lifts of the London Underground, and the total floor area of the complete building runs to nearly fourteen acres.

Test on Bitumen.

On July 23 a test was undertaken at Manchester with a view to proving the efficacy of a process recently discovered by Mr. R. O. Child, chemist of Messrs. D. Anderson & Son, Ltd., for rendering bitumen both stable and fire-resisting.

Incorporated Church Building Society.

At the monthly meeting of the Incorporated Church Building Society grants were made towards building new churches at Furzedown, St. Paul, Surrey, £150; West Silvertown, St. Barnabas, Essex, £200; and Walthamstow, St. John, Essex, £360.

Builder's Estate.

Mr. Elphinstone Forrest, of Laurel Bank, Myrtle Park, Crosshill, Glasgow, builder and contractor (in addition to considerable real estate), 5,432.

THE WEEK IN PARLIAMENT

WESTMINSTER, *Wednesday.*

Prevention of Eviction Bill.

An agreement with the House of Lords having been arrived at, this Bill has now received the Royal Assent.

Smoke Abatement Bill.

The Public Health (Smoke Abatement) Bill, which is on the lines of that introduced last year, has been read a second time in the House of Lords.

Leasehold Reform.

Mr. Comyns-Carr was granted leave to introduce a Bill to amend the law governing the relations between landlords and tenants. He said the measure was intended to meet grievances arising out of the present system of leaseholds, particularly with regard to leases for lives, building leases, and leases for the occupation of business premises. Everybody knew the blight which settled in such a place as London on whole districts for 20 years before the falling in of building leases, and the absurdity of the rule in building leases by which property erected at the expense of one man automatically reverted to another without payment. The Bill proposed that a permanent tribunal of an expert character—that already in existence under the Acquisition of Land Act, 1919—should deal with all these questions in the light of equity as between the parties. Improvements effected after the passing of the Bill would become the property of the person who carried them out, and in the event of the lease being terminated they would be the subject of compensation by the landlord.

Building Lines in London.

Mr. Gosling, Minister of Transport, in reply to Sir E. Iliffe, said he was aware that in many cases insufficient provision was being made for the future widening of important roads on the outskirts of London and other great towns. In the present state of the law it was impossible to ensure the general prescription of adequate building lines, and he was considering, in conjunction with the Minister of Health, what additional powers were required for this purpose.

Brick or Wooden Houses?

Mr. Greenwood informed Lieut.-Commander Fletcher that the cost of houses of any form of construction varied considerably, but under normal conditions, with the same standard of fittings and completion, very little saving was found to be effected by the adoption of wooden forms of construction. In a recent case a local authority considering the use of wooden buildings found that the cost of the wooden houses came out at £460 as compared with £385 for houses similar in accommodation being built in brick. The time taken to erect either brick or timber houses varied considerably; in building the timber house three weeks to a month might on the average be saved in the erection of the shell, but ordinarily there would be no saving in time on the remainder of the work, which would be much the same. The life of a brick house was commonly held to warrant a loan period of 50 years. As to the timber houses, although certain timber houses had had a long life, the general experience was that the effective life could not on average be put higher than 40 years, and it was frequently much shorter.

Entertainment Tax.

During the report stage of the Finance Bill, Mr. Snowden, the Chancellor of the Exchequer, moved a new clause to exempt from entertainment tax exhibitions of works of graphic art, sculpture and arts craftsmanship.

L.C.C. Bricks.

Mr. P. Harris asked the Minister of Health whether he was aware that there were quantities of bricks stacked at the London County Council Becontree housing estate ready to be used for constructing houses; that before the dispute in the building trade it was impossible to find the necessary skilled labour for constructing houses with them; and whether he could suggest any method by which the difficulty could be overcome.

Mr. Greenwood said bricks were stacked on this site, but on other sites there was a shortage of material. One of the main objects of the Government housing scheme was to facilitate the augmentation of skilled labour and material in the building industry and to balance the supplies of both, and he had every hope that the result would be attained.

Training an Apprentice.

Mr. D. G. Somerville asked the Minister whether, in view of the officially admitted fact that it took from three to four years to train an apprentice to become a bricklayer's tradesman, he would state how any extension of the apprenticeship system was expected materially to assist in the construction of a large number of houses which were immediately and urgently needed.

Mr. Greenwood said the problem was to increase continuously over a period of years the present insufficient provision of houses for the working classes, and the proposals for an extended apprenticeship system made by the National House Building Committee appeared the best way of attaining the desired result.

New Method of Bricklaying.

Major Kindersley asked the Minister whether he was yet in a position to express an opinion on the new method of laying bricks in cottage construction, which was being tried at Tonbridge.

Mr. Greenwood said this method was in an experimental stage, and steps were being taken to improve it. It had only been tried on a small scale, and it was not yet possible to express any opinion on it.

The Building Dispute.

Sir K. Wood asked the Minister whether the present building dispute was affecting the housing schemes of the local authorities or house-building by private builders.

Mr. Greenwood said that generally the answer was in the affirmative, though he had no specific information as to the position in detail. The Minister proposed to take no steps favouring either one side or the other in the dispute.

The New Building Committee.

Mr. Masterman asked the Minister if he would state who were to form the Committee which were to guarantee the building of the municipal houses under his housing schemes.

Mr. Greenwood said representatives of all branches of the industry would be included. The principal duties of the sub-committees would be to see that sufficient labour and materials were available for the number of houses to be erected in the locality under the housing scheme. They would have no power to squeeze out any type of builder.

Skilled Craftsmen.

Mr. Greenwood said it would be a condition of every housing contract that apprentices up to a total ratio of one apprentice to three craftsmen should be employed in certain trades, and in considering applications special consideration would be given to men with previous experience in the trade.

Concrete Houses.

Mr. Greenwood, in reply to Major Moulton, said the Salisbury City Council, under a special direct labour scheme for training ex-service men, built 20 houses of concrete. An estimate of the labour costs showed a saving of £75 a house over the labour costs if the houses had been built at contract prices. The total difference in cost as compared with brick houses built by contract during the same period was substantial. The houses were built of concrete blocks or slabs made on the site, and a large proportion of labour by trainees unskilled in the building trades was employed.

Building Materials Bill.

Mr. Clynes stated that the Bill dealing with profiteering in building materials would not be taken until the autumn session.

THE BUILDING TRADES DISPUTE

REPORT OF THE COURT OF INQUIRY

THE Court of Inquiry, consisting of Lord Buckmaster (Chairman), Mr. F. A. Hargreaves, and Mr. Arthur Pugh, which heard evidence from employers and employed on the present dispute in the building industry, has now issued a long report. (Cmd. 2192. London: H.M. Stationery Office, price 6d. net), from which we take the following:—

Representatives of the employers and operatives attended, the respective cases being presented by Mr. W. H. Nicholls (chairman) on behalf of the National Allied Building Trades Employers, and by Mr. T. Barron (president) and Mr. R. Coppock (secretary) on behalf of the National Federation of Building Trades Operatives. In addition, on the employers' side, Mr. B. B. Moss presented the case of Liverpool, Mr. H. T. Holloway that of London, and Mr. T. Ferguson that of Scotland, while Mr. A. G. Cameron also spoke on behalf of the operatives.

The National Agreement.

In accordance with a "National Working Rule Agreement," which came into force as and from April 11, 1921, the working hours were fixed at 44 hours a week, or such other hours as should be nationally agreed. By the same agreement rates of wages were determined for four standard grades, A, B, C and D, and at a later date, rates intermediate between the four standard grade rates were determined and indicated by appropriate lettering. All the federated towns and districts throughout the country were graded in accordance with this scheme. The agreement further provided that the rates of wages then determined were assumed to correspond to a cost of living of 170 per cent. over the pre-war cost of living, provisions being introduced for variation in the rates of wages by the Council at any statutory meeting. Six reductions in wages amounting in the aggregate to 8d. per hour, were effected up to and including June 1, 1922, only two of which were due to the variations of the cost of living scale under the agreement, so that when at the statutory meeting in January, 1923, the employers put forward a proposal for a further reduction of wages of 20 per cent., and an extension of the working week, the hourly rate in operation was below what a strict adherence to the scale fluctuations would have provided. After fruitless negotiations on this proposal the employers in April, 1923, issued a notice that on and from April 14, 1923, there would be a reduction in wages of from 1d. to 2d. per hour, according to the grade of the town, and that the hours worked would be 47 for the summer months, 44 for two of the winter months, and 41½ for the remainder. The operatives declined to accept these conditions.

The Fraser Award.

The dispute was referred by consent to the arbitration of Sir Hugh Fraser. The award as to wages effected a reduction from ½d. to 1d. per hour, according to the grade of the town. The award as to hours contained the following clause:—"That the present rule whereby 41½ hours per week are worked during December and January be rescinded and that the working time of 44 hours per week shall proceed throughout the year except during the period of summer time as determined by statute, when the working time shall be extended to 46½ hours per week."

This was qualified by an independent paragraph to the following effect:—"Nothing in this award shall prevent the employers and operatives in any town or area from maintaining by mutual consent the 44 hours' week throughout the year."

These awards were incorporated in the constitution of the National Wages and Conditions Council by agreement between employers and operatives. The awards were received with extreme disfavour by many of the operatives, who gave notice of amendments, the effect of which was equivalent to a claim for an increase in wages of 2d. per hour and to prevent the operation of the award as to hours in respect of the essential condition that the standard working week for summer time should be 46½ hours. There was in some cases a definite refusal to work 46½ hours. In Scotland there was a general refusal to work the extended hours.

Regarding the hours question, the report states: The words of the award are in our opinion plain, and require 46½ hours as the normal hours for summer time, with permission for local exceptions by mutual agreement, but it is possible that this proviso was misunderstood by some of the less-informed operatives and interpreted by them as meaning that the whole question of hours to be worked in summer time was to be a matter of agreement. The idea that 46½ hours was permissive instead of compulsory seems to have been widespread, and could not have been due to the wording of the award. The employers, on their side, being persuaded that 46½ hours was an essential term for summer time in the interests of the industry as a whole, recommended to their local federations to "carry out the extended hours, and refrain from any variation without first consulting the negotiating Committee of the National Allied Building Trades Employers." The result of this was unfortunate. In many cases the men asked for a meeting to discuss the question of hours, but their request was constantly refused by the employers, who took the view that, as they had definitely decided not to consent to a 44-hour week, no useful purpose would be served by discussing the matter, but the necessary consequence of this action was that any misunderstanding which did exist was not cleared away. In some districts such meetings did take place, resulting, in a number of cases, in agreement being reached. Where, however, the employers endeavoured to apply the 46½ hours week, and the operatives refused to work, there was a clear breach on the part of the operatives of the provisions of the award. It is impossible to say that these circumstances have definitely caused the cessation of work, but they have undoubtedly produced distrust between the operatives and the employers, each of whom regards the other as having unfairly dealt with the award.

Output, Overtime, and Excess Wages.

The question of output was raised by the employers, but was not examined by us, as it did not, in our opinion, come within the terms of the inquiry, since it was not one of the causes of the dispute. The employers also complained that the men refused to consider the question of overtime, although it was expressly provided that in urgent cases this should be worked. On the other hand, the representatives of the operatives stated that certain federated employers had paid rates of wages in excess of those nationally agreed, and had thereby undermined the authority of the operatives' national organisation. It is easy to see that the friction and irritation arising from these causes produced an atmosphere in which explosion might readily occur, and the crisis was indeed quickly reached.

The main cause was, in the opinion of the Committee, due to the following facts:—

Position at Liverpool.

In 1919 a dispute affecting certain building trade operatives occurred in Liverpool. At that time the Liverpool Employers' Association was affiliated to the North-Western Federation of the National Federation, and thereby became part of the allied bodies. The operatives in Liverpool refused to accept the terms agreed upon by a Joint Committee for the North-Western Area, and the joiners and others employed in the Liverpool district ceased work. The master plumbers in Liverpool, with the approval of the Institute of Plumbers, subsequently effected an agreement which granted an increase of wages of 2d. per hour. The strike of the other classes of workmen lasted four months, and in the end the North-Western Federation authorised the Liverpool Employers' Association to arrange a local settlement on the best terms possible, and this was effected by an agreement under which the wages paid in Liverpool were to be 2s. per hour as compared with 1s. 8d. per hour in Grade A towns in other parts of the country. The Liverpool employers thought insufficient support had been given to them by the North-Western Federation, and being unable to obtain any guarantee of assistance in the event of further disputes with their operatives they gave six months' notice to withdraw from the Federation, to expire on May 31, 1920, and entered into an agreement with other employing bodies in Liverpool for the joint consideration of wages in the district. Before the notice had expired the Liverpool employers were expelled from the North-Western Federation, and from that time until 1923 they remained as an independent body and conducted their own negotiations with their operatives.

On September 12, 1923, the Liverpool Association were again admitted members of the North-Western Federation, and automatically became members of the National Federation of Building Trades Employers, and since that date they have acted under the instructions of the Federation.

On October 30, 1923, the Liverpool Association, in accordance with the local working rules, gave six months' notice to the operatives of their intention to bring the wages and conditions into line with those agreed upon by the National Wages and Conditions Council. At that time the rates of wages in the Liverpool district were higher than the rates paid in other parts of the country.

On November 9, 1923, the Liverpool Employers' Association received a counter-notice from the Liverpool operatives, made in accordance with the existing local rules, claiming improved rates of wages and conditions having no relation to the awards of the National Wages and Conditions Council. This claim included a demand for an increase of 6d. per hour, a working week of 44 hours, and full payment for lost time due to inclement weather. In December, 1923, the Liverpool employers made an application to their parent body that the Liverpool district should be placed in Grade A for the purpose of determining the rates of wages payable to their operatives. After a meeting between the employers and operatives had produced no result, the National Wages and Conditions Council decided on April 25, 1924, that Liverpool and District be classified Grade A as and from May 1, 1924, it being understood that Liverpool and district shall not participate in any advance which may be settled nationally until the hourly rates of the Liverpool and district operatives are brought into harmony with the above classification; provided that if there is any differential in the hourly rates of the Liverpool and district operatives after the national settlement of wages, such differential shall be dealt with by a reduction of one halfpenny per hour on July 1, 1924, and the remainder of the difference, if any, within six months from May 1924.

On April 28, 1924, the National Federation of Building Trades' Employers and the National Federation of Building Trades Operatives endorsed and accepted full responsibility for this decision of the National Wages and Conditions Council, and representatives of the Liverpool Employers' Association pledg

r members to carry out the decision. On 26, 1924, the operatives stated that they ld not accept the decision of the Council, that unless the employers entered into a rate agreement their members would cease k. They refused to meet a deputation of national bodies of employers and opera-, and on May 31, 1924, the bricklayers masons ceased work. The Liverpool atives were members of the National eration of Building Trades Operatives, and result of their action, taken without the oval of their headquarters and in breach the national agreement, the district branch suspended. The Liverpool employers e therefore left to deal with a body of men r whom no central authority could be exer-d.

National Negotiations.

hile the dispute at Liverpool was matur- questions were arising generally in the ling trade with regard to hours of work rates of wages. The operatives demanded niform increase of 2d. per hour and a ing week of 44 hours, to which was added ain to some guarantee for loss of time to inclement weather. On May 5, while negotiations were taking place on claim, the National Allied Building les' Employers wrote to the National eration of Building Trades' Operatives g that they should make immediate ts to bring the Liverpool operatives into and stating that it would be impossible the employers to conclude any general ement of the matters then outstanding be-n the two sides of the National Wages Conditions Council unless the Liverpool atives formally accepted the national ing rule agreement and the constitution awards of the Council.

May 14, the employers proposed (i) an ase of wages of ½d. an hour in places ting those which had already been the ct of increase by upgrading since Septem-26, 1923, and made provisions as to ising wages; (ii) to set up a joint com-e to inquire into the incidence of time owing to stress of weather or other causes de the control of the workmen and make mmendations on the question of compen-n: and (iii) that the position in London ld be the subject of local inquiry and tiation. The letter expressly stated that whole of the recommendations were en-y conditional upon "the termination of erate breaches by the members of the eration of Building Trade Operatives of National Wages and Conditions Council titution, including the summer working s, overtime regulations, and the refusal of ish operatives to put into effect the con-tional awards." It also stated that the oyers felt bound to make those conditions se of the impossibility of conducting iations whilst organised efforts were made to violate the agreed constitution. reaffirmed the provision with regard to pool which was given in the letter of 5, 1924.

on a ballot taken by the trade unions sented on the Wages and Conditions cil, the terms offered by the employers eir letter of May 14, 1924, were accepted, he condition as to Liverpool was not set n the ballot notice. On June 4, 1924, the nal Allied Building Trades' Employers ed that unless the recommendations ch were to be taken as a whole and were ely conditional upon the termination of erate breaches by the operatives of the nal Wages and Conditions Council Con-ion, including the summer working overtime regulations, the refusal of ish operatives to put into effect the con-tional awards, and that the provision l by the Negotiating Committee, in their of May 5, with reference to Liverpool lhered to, including a formal acceptance e National Working Rule Agreement, itution, and award of the National Wages and Conditions Council by the Liverpool operatives) were fulfilled within a period of ten days from that date, the offer would be withdrawn and a national cessation of work shall take place as and from June 23.

The position in Liverpool was forming a central feature in the dispute, and following upon the employers' resolution of June 4, an effort was made to get agreement in that area. The terms were accepted by the Liverpool employers, and representatives of certain of the operatives undertook to recommend acceptance to their members, and stated that they would report the result by June 18. The bricklayers, masons, and plasterers definitely refused to make such a recommendation.

On June 16 a meeting took place in London between representatives of the employers and the operatives, and an agreement was arrived at with regard to all the matters in dispute on the assumption that the Liverpool operatives would accept the terms offered to them. It is a fact deeply to be regretted, states the Report, that what appears to us to have been a confusion of ideas between the employers and the operatives upon this point should have led, as we think it has led, to the final catastrophe. Agreement being, as it was believed reached, the parties withdrew, leaving the respective secretaries to reduce the terms to writing and an agreed notice was sent to the Press stating that a settlement had been reached.

After giving the statements issued to the press from June 16 onwards, the report continues: "We have no reason to believe that there was any reluctance on the part of the employers to accept and ratify the agreed terms, nor was it at all probable that they would have repudiated terms negotiated and settled on their behalf. In view, however, of the reported refusal of the Liverpool operatives to accept the special terms offered to them on June 10, 1924, the employers decided upon a definite declaration of a lock-out throughout the whole building industry, a decision due to the fact that by this means only was it thought possible to compel Liverpool to come into line with other parts of the country."

No attempt at any further agreement was made nor, except upon the telephone, was the decision as to the lock-out made known to the operatives before it was publicly announced. They therefore regarded this decision as a complete breach of faith on the part of the employers and a repudiation of their national agreements. On June 24 and 25 the executive councils of the trade unions affiliated to the National Federation of Building Trades Operatives reached certain decisions which were communicated to their members in a circular letter dated June 27, 1924. The letter authorised the local branches to conduct regional settlements on the following basis:—(i) The minimum payment of a halfpenny per hour increase to both craftsmen and labourers. Such increase not to be subject to the cost of living sliding scale, but to be regarded as an improved status; (ii) a working week of 44 hours; (iii) provisions for payment of time lost through circumstances over which the operatives have no control.

The joiners, wood-working machinists and plasterers employed in the Liverpool district ceased work on June 21 and they were joined by the plumbers on June 28.

At the request of the Minister of Labour the National Allied Building Trades Employers agreed on July 2 to postpone their lock-out notices from July 5 to 12, in consideration of the appointment of a Court of Inquiry under Part II of the Industrial Courts Act, 1919. On July 3 the operatives gave notice of a strike to commence on July 5.

Conclusions.

The conclusions of the Court are as follows:

Having regard to the importance that the different interpretations of the agreement of June 16, 1924, and of the events leading up to that agreement bear upon the final cessation of work, it is necessary to state more in detail what were in our opinion the respective views of the parties in the matter. The employers appear to have regarded the whole situation as governed by the condition expressed in their letter of May 5, again repeated, by reference, in their letter of May 14. In their view there was no agreement unless and until the Liverpool situation was settled, and the terms of June 16 were those to which they were ready to consent when that condition was fulfilled.

The operatives, on the other hand, appear to have regarded the Liverpool difficulty as a local question that did not obstruct a national settlement but called for special adjustment with the co-operation of both parties. Their views were not inadequately expressed by the provision of Clause 7 of the agreement as drafted by the employers' secretary, who was present and took notes of the discussion, for it is to be observed that, although the latter portion of this clause stated that it was assumed for the purposes of the agreement that the Liverpool operatives would accept, yet in the event of rejection it provided only for the energetic co-operation of both parties for a complete settlement of the Liverpool issue. The amendment proposed by Mr. Nicholls would have provided that acceptance of the terms offered to Liverpool was "the basis of the agreement," and by altering the words "Should unfortunately any section of the operatives fail to fall into line" to "Should unfortunately the bricklayers or plasterers fail to fall into line," his intention was to make clear that, if the terms were accepted by all sections of the Liverpool operatives excepting the bricklayers and plasterers, the national bodies of employers and operatives were to co-operate energetically to secure a settlement as regards these two classes.

The Court accepts Mr. Nicholls' assurance as to his view of the matter, but it is easy to see that it is not the view made clear in the document, and we can readily understand the failure on the part of the operatives to realise Mr. Nicholls' position, particularly having regard to the agreed notice to the Press which stated that agreement had been reached and made no reference to any condition. It is owing to this misunderstanding that the operatives have asserted that the Liverpool difficulty is not the main cause of the dispute and that it is the repudiation by the employers of the terms agreed on June 16 which has led to the cessation of work.

It has become increasingly difficult to re-establish the position at Liverpool. Mr. Wilson, who was formerly secretary of the Mersey and District Branch of the National Federation of Building Trades Operatives, expressed himself as completely without authority to act on behalf of the Liverpool operatives, but stated that they would not consider any settlement except on the basis of the local rules which were operative up to May 1, 1924.

We find, therefore, that the immediate causes of the dispute are these:—

(*a*) A claim for increased wages on the part of the operatives.

(*b*) The refusal of large bodies of the operatives to carry out the award of Sir Hugh Fraser with regard to working hours in the summer.

(*c*) The belief by the operatives that the employers had attempted to obstruct the free working of local arrangements by which the extra hours in summer time might be avoided, and

(*d*) The Liverpool dispute.

Each of these circumstances was a contributory factor and entered into the final dispute, but it will be seen that all were included in the agreement of June 16, and had it not been for the Liverpool position would have been adjusted. In our view, therefore, the main cause of the cessation of work in the building industry is the refusal of the Liverpool operatives to accept the special terms of settlement offered to them on June 10 and to submit to the decisions of the National Wages and Conditions Council. The resulting issue has been

productive of much misunderstanding between the parties. Recognition by each side of the fact that their position has not been understood by the other, the settlement of the Liverpool difficulty and the resumption of negotiations appear to be the only means by which the dispute can be brought to a speedy end and good will restored in an industry of national importance and owing great responsibilities to all classes of the public.

VIEWS ON THE REPORT.

In an interview, Mr. R. Coppock, secretary of the National Federation of Building Trades Operatives, said there was nothing in the report that affected the course of the dispute in the least. No new facts were brought out, and the conclusions were merely a series of opinions. "There appears to have been a careful analysis of the evidence given before the Court of Inquiry," Mr. Coppock added, "but there is nothing in the report to indicate that it will have any effect upon the progress of the dispute whatever."

Mr. T. Barron, president of the Federation, stated: "The report completely justifies the attitude the operatives have taken all through. There is nothing in the opinions expressed to alter the course of the dispute."

Mr. G. Hicks, secretary of the Amalgamated Society of Building Trade Workers, said it was regrettable that the Court of Inquiry had not seen its way clear to express an opinion on the question of a guarantee for time lost by the workers through the inclemency of the weather and other causes for which they could not be held responsible.

The employers claim that the Court has found in their favour in respect of breaches of the arbitrator's award fixing 46½ hours as the length of the summer working week.

Mr. T. Barron and Mr. R. Coppock (of the Operatives' Federation) and representatives of the employers had interviews with officials of the Ministry of Labour on Tuesday.

STATEMENT BY EMPLOYERS.

The employers later issued a statement, which included the following:—

"It becomes increasingly plain that Liverpool is the crux of the general situation. Everything else is amenable to negotiations, if that can be settled. The Liverpool operatives hold in their hands the peace of the whole industry. . . . The public should know the three outstanding features of the Liverpool situation to-day. They are—first, the Liverpool men want a local settlement, thus ignoring national control, whether it be from their own national organisation or from the National Wages and Conditions Council, which is a joint body. Second, their present demand is for an advance of 6d. an hour upon a rate which is already from 1d. to 1½d. above the London rate. Third, Liverpool also claims extra money allowances of various kinds. It is, therefore, for Liverpool to say whether there shall be peace or war."

The Minister of Labour has communicated with the leaders of each side to ascertain whether they are willing to meet together early next week to see if there is any basis on which negotiations can be resumed. Up to the time of going to press the respective parties had not replied.

Yesterday the Operatives' Disputes Committee and the Employers' Disputes Committee held meetings, and a meeting of the executives of the various bodies included in the Employers' Federation was also held yesterday.

Prices of Building Materials.

Sir Halford Mackinder, Chairman of the Inter-Departmental Committee appointed to survey the prices of building materials, in a report for the month of June to the Minister of Health and the President of the Board of Trade, issued as a White Paper, states that there has been a further fall in the price of lead, but otherwise there have been no changes of general application to which attention need be drawn.

RATES OF WAGES IN THE BUILDING TRAD

The following are the rates of wages in the building trade in England and Wales. E endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur

	Masons.	Brick-layers.	C'p'ters, Joiners.	Plas-terers.	Slaters.	Plum-bers.	Painters.	Labourers.
Aberdare	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Accrington	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Altrincham	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Ashton-under-Lyne	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Barnsley	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Barrow-in-Furness	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Barry	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Bath	1/5½	1/5½	1/5½	1/5½	1/5½	1/5½	1/5½	1/1½
Bedford	1/5	1/5	1/5	1/5	1/5	1/5	1/5	1/0½

PROPOSED NEW BUILDINGS & OTHER WORKS

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations: T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; B.C. for Borough Council; P.C. for Parish Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; and B.E. for Board of Education.

ABERYSTWYTH.—The Borough Surveyor has been instructed to report on the supply needed of 12 in. iron pipes for water conduit to North Parade area.

ALVASTON.—The U.D.C. has passed plans for the erection of houses as follows: Miss Hunt and Mr. Cursley, Baker-street; Mr. Ballard, Allenton; Mrs. Smith, new licensed premises, Shelton Lock.

AUDENSHAW.—The erection of a bowl house, shelter and lavatories, at an estimated cost of £250, is contemplated by the Recreation Ground Committee.

BANSTEAD.—The L.C.C. has passed a capital vote of £20,177 for the modernisation of two blocks at Banstead Mental Hospital.

BARNET.—The Herts C.C. is purchasing a two-acre site in May's-lane, for a new elementary school.

BEDFORD.—Part of Newnham houses to be rented by the T.C. and converted, at a cost of £450, into office accommodation, for the Borough Engineer's staff. Plans recommended: — Boiler-house and heating system, St. Paul's Church, for Churchwardens; house, Cutliffe-place, for Mr. E. H. C. Inskip.

BEVERLEY.—The B.S. has been asked to prepare plans for a convenience near the market. The T.C. is discussing the Hull-road improvement scheme with the Hull Corporation and the C.C.

BIRMINGHAM.—Land has been acquired at Kingsfield for the R.C. congregation of St. Dunstan's, King's Heath, as a site for the erection of a new church, schools, presbytery, and parochial hall. A large house on the estate is to be adapted as a high school for girls.

BIRSTALL.—The Co-operative Society propose to erect a new branch stores on the new housing site, comprising grocery and butchering departments, at an estimated cost of £2,000.

BLAYDON.—The U.D.C. has approved plans submitted by the Consett Iron Co., Ltd., for the erection of 142 houses at Spen.

BRECONSHIRE.—The County Main Roads Committee is to improve the Talybont-road, at an estimated cost of £2,000, and the Ystradgynlais-road, at estimated cost of £1,450.—The Llanwyrtyd U.D.C. has adopted plans submitted for erection of a new pump house at Victoria Wells.—The Brecon T.C. Works Committee has approved plans for buildings to be erected at Maeudu site by A. Tulley, and by W. Watkins, of Brecon.—The County E.C. has decided as follows: To obtain site for erection of a school, of which the plans are already approved, at Pont-Neath-Vaughan; to obtain site on which to erect a school at Glanrhyd; and to consider a scheme to be submitted for erection of central schools at Brynmawr and Ystradgynlais, or enlarging the present buildings.

BRENTFORD.—Plans passed by U.D.C.: House at Nos. 188 and 187, High-street, for Mr. E. C. Jones.—The Council agrees under the town-planning order to a proposal of Messrs. Emerson & Norris, Ltd., to erect a factory at the junction of Lionel and Great West roads.

CALVERLEY.—Amongst other plans passed by the U.D.C. were eight houses on the Ravenscliffe Housing Estate.

CARDIGANSHIRE.—The County Main Roads Committee is to proceed with a scheme for erection of a new bridge at Trecefel. The original estimate of cost was £2,200, but this did not permit of a width of bridge up to standard of Ministry specification. The Committee has decided to join with the Cardigan T.C. in the scheme to widen Bridge-street, at an estimated cost of £10,000.—The Aberystwyth T.C. has appointed a committee, with plenary powers to act, to consider the building of houses along Station-road.—The Aberayron U.D.C. has passed plans as follows: Conversion of the old Wesleyan Chapel, Victoria-street, into a bungalow, for Mr. James Thomas, Capel Ficer; public convenience to be erected beneath steps to Town Hall. The County Police Committee has called for estimates of cost of erecting a new police station and court at Llandyssul.

CEFN.—A site for the War Memorial on the Plaskynaston Estate, has been accepted by the committee, who have invited students of the Liverpool University School of Architecture to submit competitive designs.

CHESTER.—Plans passed by T.C.: Conversion of shops, 84, Brook-street, for Messrs. Crowder Bros.; house, Curzon-Park Estate, for Mr. F. J. Gould; house, 141, Curzon Park Estate, for Mr. T. E. Houghton; pair of houses, Curzon Park Estate, for Messrs. R. Dye and H. Rowlands; pair of houses, St. Mark's-terrace, Saltney, for the Exors. of the late Henry Vernon; house, Curzon Park Estate, for Mr. R. W. Shuard; alterations, Northgate Tavern and Liverpool Arms, for the Chester Northgate Brewery Co., Ltd. The following plans for houses on the Curzon Park Estate have also been passed:—For Messrs. F. Connah, J. Reynolds, H. Hoyle, J. Edwards, A. Cartwright, E. Jenkins, W. E. Lloyd, E. Whitmee, A. E. Smith, C. H. Hudspith, and L. J. Dodd.

CHESTERFIELD.—Plans passed by T.C.: Factory, Sheffield-road, for Messrs. Lamp Caps, Ltd.; house, Brookside-bar, for Mr. F. Wilkins; bungalow, Four Lane-ends, Cutthorpe, for Mr. W. Plummer; house, Oakfield-avenue, Brampton, for Mr. T. Mottram; house, Brookside-bar, for Mr. F. Wilkins; house, Hasland-road, for Mr. F. Whitham; two houses, Devonshire-avenue, New Whittington, for Messrs. S. Sims & Sons, Ltd.; house, Hunloke-avenue, for Mr. S. Wheatcroft; house, Manor-road, for Mr. Roper; two bungalows, Newbold-road, for Messrs. J. Collis & Sons; house, Brushes, for Mr. W. H. YORK.—Plans passed by T.C.: H. De Burgh, two houses, Stockton-lane; F. W. Woolworth & Co., shop, 2, 4 & 6, Spurning-street.

FIRE.

LINCOLNSHIRE.—Hainton Hall, the Lincolnshire residence of Lord Neneage, was the scene of a disastrous fire recently. The damage amounts to many thousands of pounds.

Motor Bus Station at Wembley.

The new London General Omnibus Station at Wembley, just completed, is capable of handling 260,000 visitors a day. It is situated at the south-west entrance in a forecourt two acres in extent, which provides easy ingress and egress for the 1,000 buses in thirteen services which serve the Exhibition daily. The plan, which is the design of Major C. H. Holden, F.R.I.B.A., of Messrs. Adams & Holden, architects, consists of eight parallel platforms each seventy feet long, four of which are roofed in, and each platform has accommodation for two buses. The station is so designed that the levels of the platforms and the motor bus steps are approximately the same, thus facilitating boarding and alighting. To simplify the operation of the services, illuminated indicators have been installed in conspicuous positions, thus enabling the public to locate at a glance the platform from which their bus starts; and it is possible to despatch a bus every fifteen seconds. Approximately, 50 per cent. of the visitors to the Exhibition pass through this station.

PRICES CURRENT OF MATERIALS

TRADE NEWS

f of Messrs. Oscar Moenich & Co., Ltd., vitation of the directors, recently the fiftieth anniversary of the firm, founded in 1874 by Mr. Oscar Moenich, ursion to Windsor.

e received from the National Radiator teresting pamphlet dealing with their l" hospital radiator. It mentions that heating surface it occupies much less than other types. The space between is is 1⅜ in., which gives great facility g, and allows for ample room beneath

ual sports of Messrs. Waygood-Otis, held recently at Whitefoot-lane, A record number of entries was nd the cup presented by Mr. H. C. the greatest aggregate of points was by S. Piper. Mr. Green, acknow- ote of thanks, said he did not think eting could have been better managed Bridge. Mr. C. H. Day paid special Messrs. Plumridge and Hopkins, who, re mainly responsible for the success t. Among those present were Mrs. er, Mr. and Mrs. R. H. Thorpe, Mr. l. Harmsworth, Mrs. C. H. J. Day, Mrs. Norman, Mr. and Mrs. and Mrs. F. W. R. Scott, Mr. and ncaster, Mr. and Mrs. B. P. Walker, s. L. A. Day, and heads of depart-

Obituary.

h took place recently of Mr. George uilder, Sunnyside, Merthyr-road, . The deceased, who was 82 years had lived in Pontypridd all his life, of the schools, chapels and churches ypridd and Rhondda Valleys area.

THE SCOTTISH BUILDER

PRINCES STREET

THE Lord Provost's Committee of Edinburgh Town Council recently approved of a scheme by the City Architect, Mr. J. A. Williamson, for improving the traffic facilities at the junction of Princes-street and the Mound. The difficulty of any widening scheme is the R.S.A. Galleries, with the long steps which form a feature of the front elevation.

The City Architect's proposal is that the corner of the steps at each end should be removed. By this means the narrow neck formed by the projection of the corner will be removed. It is also a part of the scheme that the footwalk should be raised to the level of the lowest step, giving an added breadth of 1 ft. 9 in. to the footwalk, a similar strip being taken off at the other side and thrown into the roadway. In this way the space between the outer tramway rails and the new kerb line would be increased to about 12 ft. The present narrow strip of roadway between kerb and tramway lines, owing to the treatment of the corners, would be reduced in length by about 50 ft. The new kerb line would require to be raised to about 8 in. or 9 in. above the street line, the pavement being graded back to the bottom line of the second step of the Galleries.

The scheme, so far, has received the approval of H.M. Office of Works. A further suggestion, which is under consideration, is that the subsidiary steps, inserted at three points in the main steps fronting the platform on which the pillars rest, should be removed. This point has been referred to the Board of Trustees and the President and Council of the Royal Scottish Academy. It is also suggested that beacons should be placed at the four points which will be formed on cutting away the corners of the front steps. It is suggested that these should be about 9 ft. high, and carry lights, and that they would serve as a guide to traffic, and be of such a character as to harmonise with the buildings. It is also proposed that, when the footway is raised, the pavements should be formed with flagging laid down in a geometrical or tessellated pattern, stone slightly differing in colour being used to carry out the pattern.

NEW BUILDINGS IN SCOTLAND

New Monkland.—SCHOOL.—Plans are to be forwarded to the Scottish Education Department by the Lanarkshire Education Authority for alterations at the New Monkland Primary School, the estimated cost of which is £1,870.

Kingseat.—HOSPITAL.—The Kingseat Mental Hospital Committee of Aberdeen District Board of Control has accepted tenders for extensions at the mental hospital. The amount of the tenders is £26,866.

Coatbridge.— COLLEGE.— The Lanarkshire Education Authority Property Committee has under consideration the question of a site for a new technical college in Coatbridge.

Forrestfield.—SCHOOL.—The Property Committee of the Lanarkshire Education Authority has instructed the master of works to proceed with the erection of a new school and schoolhouse at Forrestfield.

Dundee.—HOUSING.—Messrs. J. & E. Shepherd have prepared a scheme for the erection of 5,000 houses on four sites.

Keith.—HOTEL.—At a sitting of the Licensing Court of the Upper District of Banffshire, held in Keith, plans of proposed alterations to the Central Hotel and at the Seafield Arms Hotel, Keith, were approved.

Glasgow Exhibition.

Glasgow Corporation has arranged to hold a Domestic Welfare Exhibition in the Kelvin Hall during the three weeks commencing October 13. It will be run on the same lines as the former Housing and Health Exhibitions, but more importance will be concentrated on the interior decorations and furnishings of the home than to the construction of the buildings. The classification of sections will include house furnishings, lighting, heating and labour-saving appliances, and house decoration.

BUILDING TRADE WAGES IN SCOTLAND.*

THE following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Bricklayers.	Carpenters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Brick-layers' Labourers.	Plasterers' Labourers.

DING EDUCATION IN YORKSHIRE

Yorkshire Educational Association for ling industry held its first annual out- York recently.

evening meeting the President, Coun- eeves Charlesworth, F.I.O.B., of Shef- ferred to the efforts which the Associa- l made during the past year to assist oving the work now being done in the l schools in Yorkshire and in bringing rk to the knowledge of the building in- n the same county. On several issues l been able to record definite and satis- progress. Some of the proposals which l agreed to that evening were intended ie further channels of progress, and rly intended to encourage within the a better knowledge of, and a much use of the facilities offered to them chnical schools for the efficient training ung men now entering the industry. direction in which they hoped that gress might eventually be made lay -ordination of the work of the various of instruction now existing in York- the present time, owing to compara- ight differences, it was difficult to the more gifted students to centres ey could undertake more advanced able work, and he hoped that the on would be instrumental in obtain- oved transfer facilities.

an W. H. Birch, J.P., of York, also preciatively of the work which the on was doing to arouse a keener on the part of this great industry in which was being done on the side tion. In addition, he was sure that T. Whincup, who had been mainly le for the instruction in building sub- York over such a long period of years. was with them that evening, would him (Alderman Birch) in expressing tion for the interest which the Asso- had shown in their own efforts at He hoped that the day was not so far when, with greater support from local tatives of the industry and with the l facilities in technical education ey hoped soon to have, York would scheme of instruction for students of which would satisfy their require- n all but the most advanced work.

C. F. Smith and J. Leask Manson the members for the opportunity of them that day. They noted with that both building employers, build- eratives, educational administrative principals of technical institutions and teachers formed the constitution of ociation and were in active co-opera- urthering the important work of build- cation. They thought that such an tion was unique, and anticipated that, those responsible for building educa- e in such intimate contact with the of the building industry, the activities Association would be most successful.

e conclusion of the proceedings the teachers who attended the recent Education's course at Bradford made tation to Dr. R. E. Stradling, Director ling Research, and Messrs. F. L. F. A. Maddock, and C. K. Nicholls, e responsible for the Course.

Building Education.

ixth of the series of short full-time for teachers of building subjects which arranged in recent years by the Board tion will be held in London from July 21 st 2. There has been a record number ications from building teachers in schools to attend the course, and over ave been selected to attend—again a mber. For the third time in succession hers will be housed and most of the will be given at the Westminster Train- ge.

*Ogden Bros.—Builder's work.
*S. & J. Whitehead—Mason's work.
*Samuel Ashton (Oldham), Ltd.—Joinery.
*Edward Pearce—Plastering.
*J. Brierley & Sons, Ltd.,—Plumber's work.
*John Heywood & Son—Painter's work.
*W. Henshall & Sons—Slaterer's work.

All of Oldham.

CHESTER.—For street works for the T.C. :—

*W. Turner (Ardwick), Ltd., Manchester—	
Christleton-road	£1,317 3 0
Watergate-street	888 4 9

CHESTER.—For alterations at 22 and 24, Northgate-street, for the T.C. :—

W. Vernon & Sons, Ltd.	£360

CHESTER.—For alterations at Bishop Graham's School and adapting premises for Maternity and Child Welfare Centre, for the T.C. :—

*J. Mayes, Son & Co., Chester—£869 (with condition as to increase of wages).

CONGLETON.—For erection of 40 houses on the West-end site, for the B.C. The Borough Surveyor :—

*Young & Co., Macclesfield	£18,235

DONCASTER. For the reconstruction of the Larger Bridge at Hexthorpe Flatts in reinforced concrete, for the Estates Committee of the Corporation :—

*Hodkin & Jones	£150

DONCASTER.—For water supply works for Barnby Dun with Kirk Sandall, for the R.D.C. :—

C. Fletcher, Doncaster	£1,776 12 9
W. Wilson & Co., Newcastle	1,660 17 6
Provincial Construction Co., Sunderland	1,650 0 0
A. Storey, Doncaster	1,584 0 0
J. L. Rodger & Son, Castleford	1,425 11 7
Leadley, Firth & Whittington, Ltd., Doncaster	1,351 5 3
John Walling, Spalding	1,241 0 0
Squires & Son, Selby	1,212 0 3
Porter & Sons, Barnby Dun	1,189 0 0
*Clements, Button & Clements, Barnby Dun	1,021 6 9

EXETER.—For construction of sump at electricity works, for the T.C. :—

*Soper & Ayres	£273 3

GOSPORT.—Extension of cemetery lodge, for the T.C. :—

*John Croad	£310

HAWICK.—For relaying of High-street with ridged granite setts, for the Hawick R.D.C. :—

*Improved Roads Construction, Ltd., Newcastle-on-Tyne	£16,000

HERTFORD.—Internal decoration at Special Residential School, for the Herts C.C. :—

*Shepherd & Co.	£280 5

KNEBWORTH.—For the enlargement of London-road Council School, for the Herts C.C. :—

*R. Ginn & Son, Hertford	£5,130

LONDON.—For the erection of public convenience at Salisbury-street, for the St. Marylebone B.C. :—

*Tavener & Son	£2,154

LONDON.—For repairs, &c., at Crawford-place Dwellings, for the St. Marylebone B.C. :—

Druce & Co., Ltd.	£250 12
H. A. Brown	240 0
C. Tavener & Son	216 0
J. W. Buckingham & Sons	210 0
Fredk. Mark	198 10
*J. H. St. John & Sons	196 0

LONDON.—New shop front and rebuilding front of premises, at 224, Fore-street, Edmonton :—

Groves & Son, Tottenham	£293 0 0
W. T. & E. Yates, Edmonton	292 9 2
J. Beale, Tottenham	288 15 4
A. Drake, Enfield	276 5 10

LONDON.—For painting work at cemeteries, for the Wandsworth B.C. :—

*H. Somerford & Son	£301

LONDON.—For external painting and internal cleaning, distempering and repairs at the L.C.C. Tramways Offices, Victoria-embankment, W.C.2 :—

*Triggs & Co., Lambourn Works, Mackay-road, Clapham, S.W.4	£856

LONDON.—For alterations to 102, Elmbourne-road, in connection with widening for the Wandsworth B.C. :—

*J. Potterton & Sons'	£786

LONDON.—For supply of 80 tons of Portland cement to the Wandsworth B.C. :—

*H. J. Greenham, Ltd.—£2 11s. per ton, less 2½ per cent. with a further discount of 2½ per cent.

LONDON.—For pulling down and rebuilding entrance gates at Ellenborough House, for the Wandsworth B.C. :—

*Jas. Carmichael (Contractors), Ltd.	£195

LONDON.—For the execution of repairs to the paving of Blackwall and Rotherhithe Tunnels, for the L.C.C. :—

G. J. Anderson, Poplar	£2,585 16 11
W. H. Wheeler & Co., Ltd., S.E.	2,490 10 7
*W. Peters, Stepney	2,433 11 6

LONDON.—For decorative and structural repairs to superintendent's house, Deptford pumping station, for the L.C.C. :—

*J. Buxton, Battersea, S.W.	£160 15 6

LONDON.—For erection of 102 flats on Tyndale-place site, Upper-street, N.1, for the Metropolitan Borough of Islington. Mr. E. C. P. Monson, F.R.I.B.A. Architect to the Council, Finsbury Pavement House, 120, Moorgate, E.C.2. Quantities by Mr. F. N. Falkner, 11, Princes-street, Cavendish-square, W.1. :—

Rice & Son, Stockwell, S.W.9	£67,070
Chessums, Ltd., Tottenham, N.15	66,687
Billings, Ltd., Victoria-street, S.W.1.	66,436

THE BUILDER

A JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

CXXVII.—No. 4252. AUGUST 1, 1924.

THE EDUCATION OF THE ARCHITECT

THE sense of inefficiency in education generally must be present in the minds of all who think seriously about it. Whatever be our object in life we must all feel that it would have been better served if that object had been earlier and better revised. Unfortunately, few of us are able to elect without qualification or fear what is to be our especial vocation, or, if we can, it is probably too late to lay a really efficient groundwork and foundation for our efforts. The desire to be an architect is often founded on a totally inadequate conception of what should be the ideal qualifications. It is well if the realisation of this is made clear enough to those who lack the somewhat unusual combination of mental equipment which is needful if one is to fully reap the advantages of a satisfactory architectural education. We have progressed far on the way to systematised intelligent education for architects during the past half-century and we may point with some satisfaction to the results. We may take it that the old system of pupilage is dead or dying, but we must not forget that the system was in some respects a good one, both for architects and pupils, though, as Mr. Waterhouse points out, whilst it had some great merits in certain offices, it was rather a bad thing in others. Nowadays the student has to look for inspiration and knowledge to the teacher or professor rather than to the practising architect and with all due deference to professors the stimulating value is not altogether so good in the former case. The apprentice or pupil who is keen to be useful to his master is sure to be helped along, for as he begins to make himself of value his encouragement and help are certain. The change from pupilage to school or university means a delay in the creation of value and earning capacity to the student, and architects cannot be expected to make use of the services of those who know little or nothing of office routine. It will be seen from the papers read at the Conference this week that a great change has come over the methods and aims of those who wish to create a body of well-educated, responsible architects, and that in all civilised countries some very definite steps are being taken to that end. It should be the duty of all architects to help forward in every possible way the attainment of knowledge and good character amongst the younger members of the profession; it is likely enough that even from a selfish point of view it will be worth their while. The discussion of educational problems, moreover, helps to focus our opinions and keep alive within us the right principles and aims which should guide us all.

The papers read at the Conference do not disclose any suggestion for drastic alteration in existing conditions. One thing to note specially in the paper by Professor Defrasse is the apparently severe ordeal of the entrance examination for the École des Beaux Arts. Out of some four hundred and fifty candidates, the numbers are eliminated down to sixty. The examination is a stiff one, and would not appear to offer much chance to a student whose sympathies are mainly artistic and emotional. The written examination in mathematics, the test in descriptive geometry and the oral examination in science, would probably be a heavy task for one whose great ambitions lie in the artistic expression of building materials. If art is to make the dry bones live, it would almost suggest that it is only likely to happen in the case of a Wren or a Michael Angelo. Before passing in the second examination, a student has to face examinations in science, descriptive geometry, algebra, statics and stereotomy. In the first-class examination the chief business is competitions in architectural compositions, but there is also examination in physics and chemistry, building by-laws and regulations. It will thus be seen that the type of mind which can face all these tests in practical matters is not that which we are accustomed to associate with artistic intuition. The professors appear confident, however, that such training as is to be found in France will lead to results both scientific and artistic, whether the tendency be towards traditional expression or distinctly modern interpretations.

The apprentice system is likened by Dean Bosworth to a pernicious and cantankerous old man subject to no influence but economic ones. That was at its worst; but at its best he describes it as the most glorious system of education evolved by man. The direct influence from master to pupil or apprentice was of a nature which the association of professor and pupil cannot be expected to supply, and we shall never quite reap the advantages which accrued when an architect and his pupils were in close and sympathetic association, now that pupilage is practically a thing of the past.

Mr. Curtis Green deals graphically with the position of education in this country and speaks hopefully of the work of the schools. He stresses the importance of students aiming for the Associateship of the Institute. He thinks architects have been more impressed with the necessity of securing good draughtsmen for their own purposes than with the slow process involved in the making of well-equipped architects. If a student cannot spare the time to follow a proper systematic course of architectural education, he is obviously left in something of a backwater, and though he may attain a facility and usefulness as a capable draughtsman, he will fail to reach the status of a thoroughly well trained architect. It is at least well that those who enter the profession should fairly face the issues and realise the importance of their ultimate subject. At the same time, they have to remember that the production of clever drawings and the winning of prizes does not necessarily mean that they will be of any very great value in the conduct of an architectural practice.

At the annual prize distribution of the Architectural Association (see p. 163) Mr. Goodhart-Rendel pointed out to the opponents of academic training that the kind of genius which could not break through any academic hedge was better kept under. At the Conference Mr. Waterhouse said the present system of academic instruction was not really a break with the past. It seldom happened that a school student found himself at the end of his course in sole command of an immediate practice. As often as not his career as a graduate in architecture began or continued in a draughtsmanship. As an assistant, he would experience that happy comradeship with an elder which the abolition of pupilage might have seemed to extinguish. Friendly rivalry among fellow students had been and always would be one of the greatest incentives to progress. That was the reason why a large office full of pupils was in the Victorian days a better training ground than a small one. The schools provide that rivalry to perfection, and thus give by their very nature what under office pupilage could only come by chance.

If we add to all the other virtues and accomplishments necessary or desirable to the architect that one suggested by *The Times*, "a sound working knowledge of human nature," we may well conclude that the thoroughly educated architect must indeed be a *rara avis*.

All things considered, we are driven to the conclusion that the modern architect, if he is to hold his own in the world of affairs, will need to be more and more a product of the school and the university, with what useful adjunct of artistic inspiration he can lay hold of. The average architect of the near future may come to be more or less of a highly-trained supervisor whose multifarious accomplishments may include a capacity for turning out a passably good building, perhaps better than most of the new buildings which are springing up in our cities to-day.

But for something which shall inspire us through its nobility and dignity, which shall add to the living beauty and delight of life, shall we have to look beyond the resources of the schools? Whilst we can probably create tolerable numbers of highly efficient designers of buildings, we cannot manufacture artists. We must never lose sight of the one signal value which the artist alone can supply—we would not be thought to decry for one moment the valuable efforts being made all over the world towards a higher standard of education, but we do feel that amongst the myriad marvellous efficiencies of modern life we are apt to lose sight of the great end we have in view by dwelling altogether on the means by which we are to reach it.

NOTES

The Amalgamation Scheme. As was expected, the extraordinary general meeting of the Society of Architects, which was held last week at King George's Hall, Caroline-street, Tottenham Court-road, W.C., unanimously approved, ratified, and confirmed the provisional agreement for amalgamation between the Society and the Royal Institute of British Architects. The resolution will be submitted for confirmation as a special resolution to a second extraordinary general meeting, to be held on August 8, at the office of the Society, 28, Bedford-square, W.C., after which a petition will be submitted to the Privy Council embodying the proposals, and as there is now no opposition to them the scheme should be approved by the opening of the session 1924–5. The new session should be an unusually interesting one, and the position of the Institute and the profession much improved by the amalgamation.

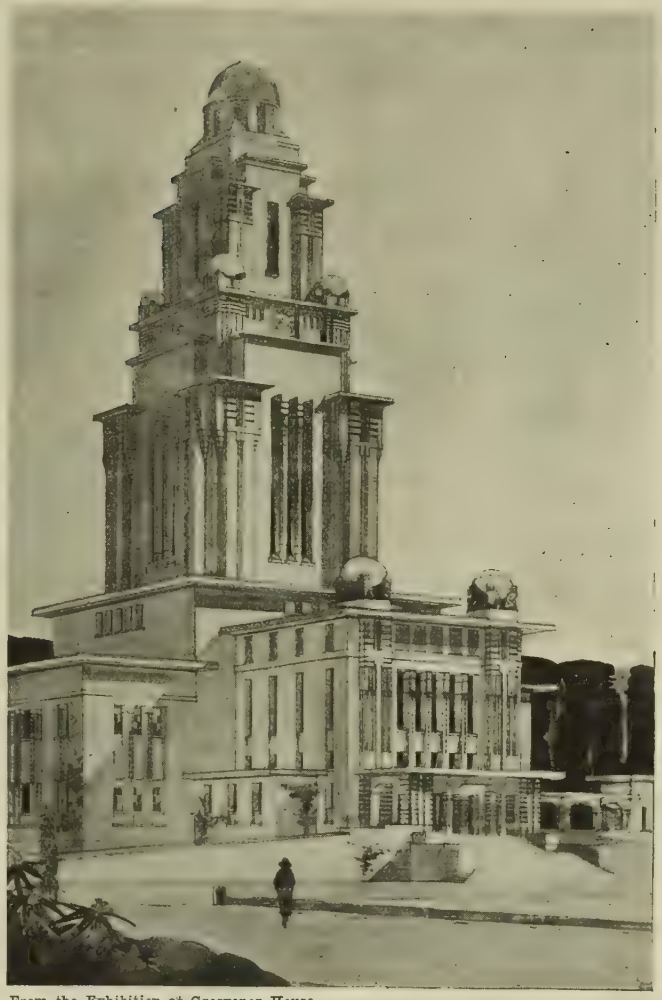
The Secretary of the Society. THE interesting dinner which was held on Thursday last week at the Café Royal, Regent-street, and was arranged by some of the friends of Mr. C. McArthur Butler, Secretary of the Society of Architects since 1898, to celebrate the twenty-fifth anniversary of his secretaryship, was no doubt timed to follow the vote of members of the Society at the extraordinary meeting referred to above, and a very agreeable little function it proved to be. Mr. E. J. Partridge, the President, took the chair, and referred to the great work which Mr. Butler had carried out for the Society and the cause it represented. In the course of a happily-worded speech, he presented Mr. Butler with a cheque for a substantial amount as some small recognition of his life work on their behalf, as well as a ring from past and present Presidents to Mrs. McArthur Butler for her sympathy and help. In the course of a charming and witty reply, Mr. Butler said the Society had earned a reputation for fair dealing which any society might envy. Their educational and Parliamentary work would be carried on and their members would be just as loyal to the Institute as to the Society. There can be no doubt that the success of the Society owes much to the indefatigable efforts of Mr. Butler, and this little tribute of affection and esteem was as well timed as it was appropriate.

Density to the Acre. IN our leading article last week we referred to the restriction of the number of houses to the acre, and we admitted that in certain cases it is not feasible to restrict the number of houses to 12, or very likely to 20, to the acre. Red-tape must be avoided at all costs, and where exceptional density is desirable there should be machinery for allowing it. This ought to be provided by the Minister retaining power to allow exceptional density in exceptional cases; but this power is too dangerous to be exerted by the majority of local bodies. We must prevent the greed of individuals or the ignorance and apathy of the less responsible local authorities from allowing houses to be overcrowded upon a site. Mr. Wheatley's solution seems to be the right one. Let the Minister of Health reserve the discretion of allowing more than the eight or 12 to the acre, but let him first satisfy himself that there is a reason for departing from the standard in the case in question.

Non-Brick Houses. HAS the subject of the cheapest possible form of building been yet sufficiently explored? There are many who think not and, consequently, Lord Middleton has given notice to move on committee in the House of Lords on the Housing Bill that an immediate inquiry be set on foot by the Government as to the possibility of building houses of other materials than bricks which may be erected more rapidly and at less cost. The difference when discovered will pro-

From the Exhibition at Grosvenor House.

An Office Building. By LOUIS N. ROSS (Harvard University).



bly not seriously affect the economic ficulties of the Bill, but the inquiry is rth while.

chitecture and the Crafts.

THERE is need to give attention in the subjects discussed at the Conference on Architectural Education to the portance of a better appreciation of iftsmanship. So often the architect, ccessful in his planning of mass and portions, fails when he comes to craftsnship to distinguish between the real, product of vision and a personal atment, and the substitute, which is king in both. It is sometimes asserted t it is because he finds it so difficult to the right appreciation of architectural ds from the craftsman that he designs ll himself, leaving only to be registered precise copy-like fashion what he has so igned—more often without knowledge he resources of the material for which has designed it. The ability to work ough other minds, to draw forth the ies of personality with which to engthen his own work, is one which he en neglects, and architecture suffers n the poverty of the single mind which the inevitable consequence of such lect. There are architects to whom credit is due for their appreciation of advantage of this collective strength h for architecture and the arts as a ole, and we should like to see some erence during the Conference to the vantage of architecture raising the ndard of its appreciation in this direcn and depending less on the conventional ducts of a pseudo-craftsmanship, touched by individuality and genuine atment.

rchitects and Gardens.

THE leading article, "The Literature of Landscape Gardening," in the *Times Literary Supplement* of y 22, followed on June 4 by *Punch's* dener of the old school: "What! 't like geraniums, calceolarias an' elias?" offers a fruitful field to student cynic. Is what we call taste only a ter of vagary, and is the artistic mode the hour as simple and infectious as k-eye at a preparatory school? We not attempt an answer to these specuons, but we do say definitely that most itects (and all young ones of spirit) eve themselves to be specially enred with the instinct of garden design. ortunately, when an opening arises, r professional conscience interferes, client is warned of limited experience actual practice, and as a result the cialist is summoned from his lair; and annex to last spring's Olympia or lsea bursts into ready-made existence. ideal combination must be client, st and gardener; if the young archi is approached he should not venture assist—let him plunge. In this way y shall we achieve interesting gardens.

From the Exhibition at Grosvenor House.

Drawing by J. VAN DER STEUR (Technical College, Delft).

Gasometers.

THE gasometer is an ugly creature, but need it stand out as gaunt and conspicuous in its ugliness as it does? The gas industry is outstanding in its enterprise, and we suggest that much might be done to tone the gasometers into their surroundings by treating them as we did our merchant ships during the war, and camouflaging them to blend in with their surroundings. Even the crudest colours can perform wonders, and a one-coloured gasometer that now stands out conspicuous for miles would vanish from view if it were painted in stripes and patterns of different colours. Perhaps the British Commercial Gas Association will suggest these possibilities to the various gas companies.

"Stucco Shams."

"THE STAR" of July 25, in an article dealing with Regent-street entitled "Home Truths for Cranks and High-brows," informed us that the new buildings are "a financial and artistic gain." The interest in architecture which such articles demonstrate is all to the good, and we welcome it wholeheartedly, even when the sentiments expressed are hardly architecturally reasonable. We here find a comparison instituted between "the imposing piles of white Renaissance palaces with those heavy, low-ceilinged frontages and the two rival colonnades at the south end . . . the rapidly departing atrocities of Nash." The article not being signed we have no gauge as to the competence of the author to speak on the subject, but there are many members of the architectural profession who would prefer the old Regent-street to the new.

The Liverpool Cathedral Interior.

AMONGST the many illustrations published of the interior of the Liverpool Cathedral, it may have been noted by those who have studied the building itself that nothing has yet appeared which quite gives the full impression produced by its great height. The view we publish this week was sketched in the Cathedral a few weeks since by Mr. Davison, and aims to give something of the impressiveness produced by its emphasis of height and its simple breadth and dignity. Whilst it is decorated by a wealth of beautiful and delicate detail the breadth of plain surfaces and strong unbroken lines of articulation are only emphasised and in no wise disturbed by the variety and interest to be found in the carving, modelling and tracery.

GENERAL NEWS

Professional Announcements.

M. Marcel Péchin has been awarded the Grand Prix de Rome for architecture by the French Academy of Fine Arts.

Messrs. Mackey & Curtis, AA.R.I.B.A., have removed to 27, Buckingham-gate, Westminster, S.W. 1.

Peterborough Cathedral.

The Bishop of Peterborough has signed an appeal issued by the Peterborough Cathedral Restoration Committee, asking for £10,000 to restore the roof of the Cathedral, which has been found to be damaged by the death watch beetle.

Royal College of Art.

At the recent distribution of diplomas at the Royal College of Art, South Kensington, Mr. M. A. Halim was awarded a Diploma in the School of Architecture.

Memorial to Sir G. Newnes.

A memorial to Sir George Newnes, Bart., has been erected in St. Bride's Church, Fleet-street. It has been designed by Sir Edwin Lutyens, R.A.

Liverpool Cathedral.

The Liverpool Cathedral Committee, in a statement to the press, express the hope that it may be possible to proceed at once with the erection of, at any rate, the great central space under the tower (to an interior height of 170 ft.), with the western transepts adjoining it. It is estimated that these will cost, approximately, £300,000, in addition to the funds which the committee have in hand, and for this an appeal is now made. The sum named will not cover the cost of the tower above the great central space, or of the nave beyond the western transepts.

Obituary.

The death took place recently, at the early age of thirty-seven, of Mr. William Thorne Wilmot Ching, M.C. (former A.R.I.B.A.), youngest son of the late Thomas Ching, of Auckland, N.Z.

The death took place recently of Mr. A. Y. Nutt, M.V.O., for many years resident architect at Windsor Castle. Mr. Nutt executed many etchings of places of interest in the neighbourhood of the Castle; also the annexe of Westminster Abbey prepared for the Royal wedding; and the Royal Mausoleum.

Mr. Josiah Goodchild passed away on Sunday, July 13, at his residence, Hampstead-way, N.W., in the eighty-third year of his age. He was long associated with his father, who had a practice as a surveyor, acting frequently for the late Mr. Penrose, and in the early days of the London County Council. Mr. Goodchild was elected District Surveyor of North Islington, one of the first under the new conditions, and this post he held (having N. St. Pancras as well part of the time) until his resignation a few years since. He was President of the District Surveyors' Association just before his resignation.

Mestrovic Exhibition.

In view of the continued interest in the Mestrovic sculpture, the Exhibition now on view in the Galleries of the Fine Art Society will remain open for another week.

British School at Rome.

The designs prepared by the candidates who competed in the Final Competition for the Rome Scholarship in Architecture, 1924, and the R.I.B.A. Henry Jarvis Studentship, 1924, will be on exhibition in the R.I.B.A. Galleries from August 5 to August 15 (inclusive), between the hours of 10 a.m. and 6 p.m. (Saturdays, 1 p.m.).

Paisley War Memorial.

This memorial is situated at The Cross, Paisley. The sculptor of the bronze group is Mrs. Meredith Williams, of Edinburgh, and the casting of the group was executed by Messrs. J. Singer & Sons, Ltd., Frome, Somerset. The builders were Messrs. Neil McLeod & Sons, Ltd., and the carving was carried out by Messrs. Allen & Sons, both of Edinburgh. Mr. John Wornell (clerk of works, Paisley Abbey) acted as clerk of works. The pedestal, wing walls, and paving are of granite from Shap Fells, Westmorland, supplied by the Shap Granite Co., Ltd. The memorial is illustrated on p. 159. Sir Robert Lorimer is also architect for the completion of Paisley Abbey.

New Bridge for York.

The York Corporation are proposing to build a bridge over the Ouse at Clifton Scope, at a cost of £73,500.

Incorporation of Scottish Architects.

At the last monthly meeting of the Incorporation of Architects in Scotland (Mr. John Keppie, president, in the chair), it was resolved to send congratulations to Sir G. Gilbert Scott, R.A.—There were presented by Mr. A. F. Balfour Paul four framed illustrations of work by the late Sir R. Rowand Anderson to be hung in the premises.—The new regulations for architectural competitions recently issued by the R.I.B.A. were directed to be printed by the Incorporation in Scotland.

The London Building Acts.

The London County Council, at its meeting on July 29, decided that its architect, Mr. G. Topham Forrest, should visit America in the early autumn of this year in connection with the suggested amendment of the London Building Acts and the revision of the Regulations with respect to the construction of buildings wholly or partially of reinforced concrete. The Building Acts Committee expressed the opinion that in the public interest the Council should have the most up-to-date information and advice upon modern methods of construction, particularly in regard to buildings of reinforced concrete and steel-framed construction, and they therefore considered that their architect should visit America to investigate and report upon the subject.

COMPETITION NEW

Selby War Memorial.

The committee, out of five sets of plans s mitted by architects for the proposed new W Memorial Hospital, has accepted the des submitted by Mr. Leslie T. Moore, F.R.I.B. London.

Kovno.

The following premiums have been awar in the competition for the Lietuvos Bank bu ing at Kovno :—

First (1,000 dollars).—Messrs. Gasc & Bul Paris.

Second (700 dollars).—Ernest A. Serck, Be

Third (500 dollars).—M. Peveris, Kovno.

Cambrai and Soissons.

The Director of Works informs us that last day for applications in this competition the same as for Betune and Armentieres, January 1, 1924.

London Hotel.

Designs for a row of shops, with an hotel Premiums of £150 are offered for the sele designs. Particulars from Mr. H. Wald Imperial Hotel, Russell-square, W.C. 1.

Public Baths, Newton-in-Makerfield.

The Council has appointed Mr. A Thornely, F.R.I.B.A., assessor in this petition. Applications not later than Jul Sending-in day, September 30. Condi can be seen at this office.

Other Competitions.

Other competitions still open include following (the dates given are, first the sen in date, and second the issue of *The Build* which full particulars were given):—Ross-S Memorial (Sept. 30; Feb. 21). Harrogat firmary (Sept. 30; May 30). Hamilton Memorial (Sept. 1; May 30). Glasgow School Memorial (Sept. 30; June 13). Ma Memorial (Aug. 22; June 13). Bexhill E tainment Hall—Banned by R.I.B.A. (Sep May 30)

An Italian Exhibit at the Exhibition at Grosvenor House.

SWEDISH AND DUTCH DRAWINGS

BY HOWARD ROBERTSON.

understand the work of the foreign schools Grosvenor House without knowledge of methods of training is impossible. A school receive its students after a preliminary in- tion in the workshop, another may receive its, as is generally the case here, direct from ol: in each case the system will affect the od and the result. Of the systems adopted oth Sweden and Holland we know a little, will shortly know more; but under the nt circumstances criticism of the drawings bited is bound to be slightly superficial.

e exhibition of Swedish work from the l Academy of Stockholm stands out, side de with that of one or two other schools, as rating the truth that in architecture it is uilding and not the drawing which should e aim of the architect. There can be no ger antithesis to the work of some of the merican schools than this display of quiet ns which reveal their quality only to the observer. This impression of discretion not depend on the fact that the drawings epresented only by small photographic ductions—some of the American schools epresented in similar fashion and are at an disadvantage—but derives very largely a sense conveyed that the drawings are not ch projects for buildings as drawings from ings which are erected. Every architect s that some of the finest work is defective, the display standpoint, in its portrayal by ing. There is apt to be an absence of r, of brilliant spots which sparkle with the r flick of a soft pencil point; so much so designers, wise in their knowledge of human ness, are prone deliberately to prepare over- rated competition drawings with a mental ration that, if and when the job is secured, runing knife will be set to work. The ish designs represent the " after-pruning " d, they reach that stage of study when nation has been called upon as a design

er the magnificent display of work recently ited at the R.I.B.A. it would be ungracious mplain of these rather slight photographic ductions. But our friends the Swedes not grumble if the hurried architect, eager filling meal of buxom temples on luxurious grounds, hurries past the delicate *hors re* which they have provided,

is precisely in this delicacy of handling that er might seem to be lurking for the Swedish nt. A feeling for refinement so cultivated, se of nicety in design so stressed, might ivably result in an eclecticism almost ish—merely because these traits would be oped at too early a stage. It is conceivable agine—one, in fact, often experiences—that of mind in which there is present an intense e to be coarse and brutal in the face of ate restraint. What induces such thoughts e suspicion of the precious, the supercilious, ffeminate. There is, in the writer's opinion, a suspicion that these traits may develop e Swedish art, at the expense of breadth frankness of treatment.

far as one can judge from the photographs, wedish teaching must be thorough and well ed to their conditions. A strong feeling aftsmanship is evident; apparently many e students must have received some first- experience of manual training. There is od deal of maturity noticeable in the ing of various materials, a feeling for priate forms and treatment. The con- ion drawings are simple, almost naïve, but so also are the plans and elevations of the ete buildings. We have seen at the .A. photographs and models of buildings d from such plans, and they have the same nt quality. One imagines that it is all tly adequate.

photographs range through six years of g. The first and second year work deals with designs for buildings on a modest scale. There are no drawings of the Orders, no sheets to explain the teaching of historical periods and study of tradition. One sees charming drawings, of delicate *métier* portraying designs discriminating in their proportions and studied in their effect as buildings. A small library and a little week-end cottage are typical examples, designed in a spirit of genial refinement. The third-year work aims higher. Designs for an apartment house (31–35), two courtyard schemes, a dwelling-house, (46), and a country house (40–45) are each full of character The courtyards have a slightly archaic flavour spiced with Percier and Fontaine, but the country house deserves careful study. It has a charming plan and elevations, influenced, one imagines, by Mr. Ahlberg, and the rooms are delightfully and simply shaped. Not a competition scheme this, but one to be built. Sketches—a floor design, a fountain, a standard —show similar influences, and all are good in quality.

The Fourth Year is still more ambitious, and perhaps a shade less stimulating. There is a scheme for Popular Baths (52–55), and a " Guild Building in Upsala," interesting especially by its study in a model. Indeed, the Swedish seem to use the model to great effect; for in the Fifth-Year " School of Arts and Crafts " and the Sixth-Year " Railroad Station in Stockholm " (97–106) every aspect of the design seems very seriously to have been considered in the round. This latter project is very interesting to those who have studied the Stockholm Town Hall. It is extremely carefully schemed to harmonise with, and yet provide the proper foils to, Ostberg's splendid masterpiece. The Fifth and Sixth-Year work generally is considerable in scope—town planning on a good scale and large buildings—but generally the monumental designs are less intriguing than the handling of smaller subjects and details. We cannot conclude this review without mentioning the measured drawings (71–73) of old Swedish buildings. The photographs show the most sensitively-handled interior studies and the most delicate patterning imaginable. What a pity the original drawings are not available!

Through the doorway, in the adjoining Room 2, we find one of the best organised exhibits in the Congress, that of the Technical High School at Delft, now under the able directorship of Dr. Slothouwer. Here we see a school which is working on lines more obviously parallel to those of the English training centres. There are the same five-year course, the same groundwork preparation in geometry, construction, technique, and expression, with diversity of aim and results only where one would naturally expect them, namely, in the design section.

The impression gained from a study of the Delft work is that of great thoroughness and very excellent technical equipment. One feels that these young architects would capably handle an engineering problem—in fact, we understand that in the early stages of the course both architects and engineers receive a preliminary training. It seems indeed that the constructional side may have been developed to some extent at the expense of creative imagination in design. The Delft School must not be confused with the Reijks Academy in Amsterdam. At the Architectural Association some eighteen months ago we were interested in and somewhat astonished by these modernist Dutch designs which had so much power and not a little crudeness. There was, however, manifest in that work an effort towards a fresh expression, an attempt to revert to simplicity of mass and obtain effect by the elimination of the inessential. We confess to a feeling of disappointment that more of this effort is not evidenced in the work from Delft. It is all so excellent in technique, so conscientious in presentation, so careful and so thorough, but somehow lacking in design interest and " salt."

In the First and Second Years we see the technical preparation, and the beginnings of an interesting course in decorative art. And in the Third, Fourth and Fifth Years the development of the design training. The Third-Year work is mostly domestic, clean and sensible, but suffering from hesitation in the adoption of any style or expression. We prefer, for example, the definitely exaggerated gables and steep red roofs of the " small country house " to the semi-English type above it on the wall. Worthy of note is the delicate drawing of the plans and sections of the latter scheme (Nos. 18 and 19), and also the excellent execution of the detail sheets. In the Fourth Year there is a school (16–18)—a little dull, but with an interesting fenestration—an attractive coloured interior for a chemist's shop (No. 5), and a still more interesting Banking Hall (No. 1). This latter scheme with its patterned bronze grille is really suggestive of modern design possibilities.

In the Fifth Year the most interesting drawings are those for a congress building, with a semi-oriental massing and a far-away suggestion of the later manner of Sir John Burnet in the handling of planes and recessions. The detail, however, is uninspired and distressed, with a flavour of Otto Wagner, rather faded, saved, however, in the drawing by a broad and vigorous rendering. Schemes for a casino worked on squared paper appear well planned, with some confusion in elevation—less interesting than the Kurhaus on another wall, with its long green roof and good contrast of horizontal and vertical.

All the Delft drawings are worth examination, not the least interesting being those contained in the admirably arranged stand portfolios. An exhibition so well planned as this is a delicate compliment to the Institute which one feels sure will be appreciated.

We must not conclude without mentioning three casts of modelled subjects. Simple, vigorous, and interesting, this work is decorative and promising. It is of the type which sends the critic away with the feelings that, after all, work may sometimes be play.

Paisley War Memorial. SIR ROBERT LORIMER, R.S.A., Architect. (*See p.* 158.)

CORRESPONDENCE

The Dispute in the Building Industry.

SIR,—I would like to make a few observations arising on your Editorial comment of July 25, on the dispute in the building industry, and on the article, "Some Reflections on the Building Trades Dispute" contributed by me to *The Builder* of the same date.

I agree with you in thinking that had the Building Trades Parliament (the Joint Industrial Council for the Building Industry) been in existence to-day, we might have been spared the present unfortunate dispute. The causes of its practical dissolution are well worth considering. In the opinion of the writer, for what it is worth, the real underlying cause was the nature, in the employers' view, of some of the proposals embodied in the Report of a Committee of the Building Trades Parliament which, though concurred in by some employers, was regarded with the utmost alarm by the majority. Notwithstanding that this Committee had done most useful work, and that the employers were in thorough sympathy with many of its proposals for the good of the industry, yet the features of the rest of the Report alienated the great majority of the employers. The result was that employers and employed only met to consider wages and conditions (on the Wages and Conditions Council), and grading and disputes (on the local Conciliation Boards). This was their only business with each other.

Now, what would become of a business if the partners met only to discuss the division of profits, and not the conduct of the business so as to secure and make profits? It may be argued by some that employers and operatives are not partners, and that there is no analogy. But I think it has come to be recognised that there is a quasi partnership (though not in a strict legal sense) between them, and that the best results come from such a recognition. It is around the terms of the partnership that differences have arisen, that is to say, the basis on which profits are divided, the share of the workers being the wages paid for their share in the works, and as to the hours of their attendance at the business. It is just this idea of partnership between employers and employed, and their working to mutual advantage, which is at the bottom of harmony between them, and which underlies the Whitley Report and the establishment of the Joint Industrial Councils recommended by it.

In the case of the building trades, the master has been frequently originally a tradesman operative himself, whose business has extended so that he has associated with himself other tradesmen operatives employed by him on wages, the underdog—if he may be so termed—being the unskilled "labourer." Then we have the builder in a large way, employing masons, bricklayers, carpenters, painters, plumbers, &c., all of whom unite to produce the complete building. Thus, the idea of partnership as applied to the building trades has a foundation. The advantages of meeting to consider and discuss the common interests and concerns of the trade seem obvious, but the occasions for such meeting are now regrettably absent.

W. H. STOKER.

Barry, Pugin and Brooks.

SIR,—The Royal Institute of British Architects has done well in recently exhibiting some of the beautiful designs and drawings of Sir Charles Barry and of James Brooks.

The article in *The Builder* of July 11, 1924, under the heading of "Exhibition Notes," and the subsequent letters of Mr. C. F. A. Voysey, Mr. Arthur T. Bolton, and Mr. Maurice B. Adams afford most interesting reading; and I think Mr. Maurice B. Adams has expressed the feelings of all of us, to-day, by the words, "Rightly judged, Barry and Pugin ought to rank as joint Architects of the Houses of Parliament."

I am only "butting in" now by expressing the hope that the beautiful drawings of Sir Charles Barry and of James Brooks have been seen, and studied, by architects, old and young. The virile designs and drawings of Brooks must have delighted all real lovers of ecclesiastical art, particularly his designs for Liverpool Cathedral. Barry's drawings are astounding by the skill and patience shown, reminding one of what must have been a dreadful strain upon the eyesight in executing Japanese cloisonné.

As the writer of the article above referred to observes, "the drawings supply an eye-opener to those who, in these days, affect a slipshod style." The section through the Central Hall of the Houses of Parliament, and the drawing showing an elevation of the Victoria Tower, are really marvellous. Brooks, Barry and Pugin re-create in me a love of real Gothic, with an accompanying distaste of "original thought" in that style. One cannot play with Gothic Architecture! WM. WOODWARD.

The Architectural Association.

SIR,—I made a point of being present at the A.A. prize distribution last Friday, as one of the seniors, Sir Aston Webb and Mr. A. H. Kersey having been elected with me in 1867. There is a name in the list (1861), but as it appears in no other list I conclude that the gentleman has passed away. I took part in the 'eighties in the efforts made to give better teaching in the A.A., and I think that few of us dreamt that in 1924 we should have such a splendid school and a noted politician to attend our prize giving. Long may it prosper!

HENRY LOVEGROVE.

THE SOCIETY OF ARCHITECTS

MR. E. J. PARTRIDGE (President) occupied the chair on Thursday last week, at an extraordinary general meeting of the Society of Architects, held at St. George's Hall, Tottenham Court-road, for the purpose of considering a resolution approving and ratifying the provisional agreement for the amalgamation of the Society with the Royal Institute of British Architects.

THE PRESIDENT said the object of the meeting was explained in the notice, and the resolution was put forward by the Council with the fullest confidence. They had been considering the subject with the Institute very carefully during the past nine or ten months, and had come to the conclusion that it was the best course to pursue for the purpose of advancing the interests of the profession at large. The Council had received 537 proxies, and of these 527 were in favour of the resolution. The Council did not anticipate that any amendment would be proposed, but if anyone desired to do so he would rule that voting could only take place on a direct negative. It would be a straight vote, for or against.

MR. A. J. TAYLOR, in proposing that the agreement be confirmed and that the Council be directed to carry it into effect either with or without modification, said the only reason for the Council placing the resolution before the members was contained in clause 6 of the agreement, viz.: "When and so soon as this agreement shall have become absolute the Royal Institute shall forthwith promote and use its utmost endeavours to carry through a Registration Bill until it becomes the Act of Parliament and for this purpose forthwith and before the Society goes into liquidation to appoint a Registration Committee. The Society shall have the right to nominate one half of the members of such committee." In other words, the proposal if carried through would enable the Society to fulfil the promise that if the R.I.B.A. would take up registration in earnest it would step aside and give the Institute its support. Amalgamation was merely a means to an end, and in this case they j justified in accepting the means in orde attain the end. The Council was satisfied the most certain and, in fact, the only wa obtain registration was for the two bodie become one and become the most represent and powerful organisation of its kind in world. The larger number of members of Society practised in the provinces, and k the need of a real accomplishment of this obj and the practical unanimity with which th ey received the proposal justified the anticipa that those present would go one better give a unanimous vote in support of resolution. He thought the Society had g an object lesson to other institutions as to w could be accomplished by individual collective loyalty and support given to th who were chosen to look after the administra of its affairs. He trusted they would cast asid questions of self interest, and with a unanim voice give the Council power to carry out agreement as it stood. He wished to exp the appreciation of the negotiating comm at the way in which they had been met by representatives of the R.I.B.A. Agree had not been come to easily, and frank v had been exchanged, but throughout Institute had shown a keen desire to deal the matter on fair and equitable lines an try and arrive at a mutual understanding.

MR. C. H. MEAD seconded the resolution said he was satisfied as to the absolute fai of the whole thing. Consideration had given not so much to the individual as t profession as a whole, and that was a which everyone must bear in mind. The not possess the status of the doctors and lawyers, but there was no reason why they sh not. They would not, however, until obtained Registration. When Registratio granted they would stand in greater favour the public; they would be dubbed "archit and that word would have a real meaning

MR. G. LOVELL said he claimed to have in the past one of the most strenuous oppo of amalgamation. The Society had bee leaders of every progressive movement i profession in the past 20 years, and it was reflection to him to feel that the strong po they had held would pass away. What soled him was the knowledge that they w still have the support of the Secretary o Society in carrying forward the schem registration. He hoped they would still their premises in Bedford-square as the ho the Registration Section of the Institute, they knew Mr. Butler was at the head o would give them a stronger sense of security if they went to Conduit-street.

MR. E. BARE supported the resol Registration, he said, was the object o Society when it was formed and now the the chance of the object being consumate must all feel thankful.

MR. A. J. MURGATROYD (Manchester) s had been in touch with architects in the towns in the North for 20 years and he that the clause in the agreement with reg registration settled the whole thing.

The resolution was then passed unanim

MR. LOVELL proposed a vote of thanks Council for the work done.

MR. W. H. MAY (Plymouth), in seconding that in the West of England architects practically unanimous as to the need for tration. London architects were not probably, of the kind of competition the in the provinces, and the sooner regis came the better for the public.

MR. H. BRANCH said he was an o member of the Society and one could not the past without recognising that it had r its manhood, and he was hopeful for the The reason why architects had attain position they had to-day was becaus dealings with the public were based on —they had the spending of other p money, and charged them for doing so.

The vote was carried, and the PRE briefly replied.

AMERICAN SCHOOLS OF ARCHITECTURE

By Professor C. H. REILLY.

The American schools of architecture have ade a very fine display at Grosvenor House. ey have paid us the compliment of treating e Congress we have called together very iously. Being older institutions than our own nools, they have perhaps more experience in lecting work for exhibition purposes and in termining the form in which it is shown he great New York School of Columbia Univer- y, for instance, has gone to the trouble of aking one large frame for the space allotted it. In the centre of this is a large drawing what appears at first sight to be the plan of cathedral. In the bays of this are written symbolised the various subjects of study ring this course. The whole plan is indeed t the plan of their work, very decoratively d appropriately shown. As the space given this school does not allow of complete draw- gs, round this plan are grouped small repro- ctions of drawings, and then in larger panels, ecimen sheets. Enriched mouldings divide e panels, and the whole is on a grey cloth ckground. I mention this to show the expense d care to which our American friends have t themselves so that we may understand at they are doing.

A whole wing of the ground floor of Grosvenor ouse is given up to the American work, and impressive show it makes. In spite of the e of the country, there is a continuity and nilarity about the work of the American nools not to be found in that of the English nools at Devonshire House. This is largely e to the efforts of the American Beaux Arts stitute of Design. Most of the schools seem compete for its recognition by attacking the oblems it sets. The same programmes there- re appear time after time, and you can compare, y, the solutions of the Boston "Tec." with ose of Harvard or those of Pennsylvania with ose of Washington. There is, for instance, set of delightful schemes for the decoration a cabaret which have come from all parts the Continent. It is obviously a subject nich has appealed strongly, and each school s felt it, and it has called forth work worthy exhibition. Another favourite subject has en a tall office building on the lines of the cent *Chicago Tribune* competition. Our own stitute Prizes have been kept out of the schools they might have produced similar results. hether we desire, however, our English nools to be as uniform in outlook and in sult as the American appear to be is other question. What, however, we may all nestly desire is an equally high standard of aughtsmanship and presentation. On the hole, then, things are very much better in e American section of Grosvenor House than ey are with us at Devonshire House.

Perhaps, though it is very difficult to decide hen many are so nearly equal in merit, Boston stitute of Technology—"The Tec.," as it is town all over America—has the finest show. must be admitted that it does this largely eliminating the work of the early years. is applies to several of the schools. Of course, s Boston School has a long tradition behind The great Depradelle was teacher of design en I knew it first, and to-day they maintain ir high standard of draughtsmanship, as well their rather French outlook, by having in pradelle's place M. Ferrau, who won the Grand x de Rome in 1914. Harvard, which is hung posite, also has a Grand Prix professor in Haffner, the 1919 winner, and French uence is beginning to be very apparent in ir work, too. I say "beginning to be" nuse the Harvard School for many years lout against France and sided with England, ne can use such terms. At present she ns to be hesitating between the two modes, is in the danger of the person who tries to n two stools. One of the finest renderings, ever, in the whole exhibition is to be seen scheme for a tall office building shown nst a stormy sky.

The University of Illinois, in the same room, exhibits some excellent nine-hours sketches, particularly one of a reviewing stand; but it also shows a tall obelisk-like building called a "Beacon of Progress," too near to Depradelle's famous design to rank as original work.

On the back of the large centre screen, occupying a similar space to that of the Boston "Tec.," is the work of the Washington School. Although this school shows some especially clever renderings, such as the drawing of trees, as Wilson Steer might draw them, its design does not appear to me to reach as high a standard as does that of some of the others. After all, even at a school of Architecture, rendering is not the end but the means, and it is because a certain ex-English professor felt this so strongly and was, in consequence, led to make an attack on certain English Schools that the Congress came into being. I feel he might draw some useful arguments from the Washington exhibit, though I think he would approve of the catholicity of the work, which seems to range with equal facility over Romanesque, Gothic, Classic and Renaissance motives.

The Carnegie Institute of Technology at Pittsburg, with which in its early days that magnificent draughtsman and very successful competition expert, Mr. Hornbostel, of Hornbostel & Palmer fame, was associated, shows on another wall of the same room a very fine series of designs, mostly, however, in elevation only. There is a library design in the later manner of Mr. Cass Gilbert, which is one of the pleasantest things in the exhibition. A museum front is well shown in a different scheme of rendering, and there are the usual gay designs. This School has a very attractive exhibit.

Cornell, which is in the same room, has been more strict in carrying out the instructions of the committee in trying to show examples of the various stages of its course. With the small space allotted to it, however, this has meant that it has had to show in the mass of its work small reproductions instead of original drawings. It has made one glorious exception. There is a magnificent sketch of a very fine subject—a floating grand stand for a regatta—which not only exhibits great skill in the rendering but much power of design.

Sad to relate, the Pennsylvania School, under its famous professor, M. Paul Crêt—the only French professor, it is said, who has settled down and gained a great practice in America—is banished to a narrow corridor. This is probably because the School did not go to the expense of mounting its drawings. Liverpool, at Devonshire House, though it did not thereby lose its rooms, suffered in the same way. Architects, however, should not be deceived in the result. They will not be if they look carefully into the Pennsylvania drawings, particularly the coloured ones for the cabaret and other interiors. These show astonishing skill in rendering as well as power in design. Yale University, the Georgian School of Technology, the University of Michigan, all have small exhibits which, if they were from any of the smaller English or Scotch Schools, we should think very good indeed. Our standard though for America is higher than for ourselves. With her schools we expect accomplishment and get it. What we do not find, and what perhaps is not to be expected in so vast a country, which in many ways has not yet found itself, is any indication that a national type of design, such as a small country like Holland or Sweden can show, is growing up. With a vast continent like America I am not even sure that it is desirable. We all know this, that the general standard of work in American cities is extraordinarily high, much higher than with us, and for that standard the American Schools of Architecture with their carefully-planned curricula, their professors of international fame, and their keen inter-school competition, are responsible.

FRENCH AND OTHER FOREIGN SCHOOLS

By H. P. Cart de Lafontaine.

One of the most interesting exhibitions which has been arranged under the auspices of the R.I.B.A. is the collection of drawings illustrating the work of students of architecture in the chief schools of Europe and America now on view at Grosvenor House. The object of this exhibition was to enable delegates attending the international Congress on Architectural Education to compare the results of training in the various countries of the Old and New Worlds, and for this purpose each of the schools invited was asked to send a representative collection of drawings illustrating as far as possible the progress of the architectural student through the whole course of instruction.

This lends a particular interest to the exhibition and demonstrates the influence of school traditions, national characteristics, and the development of the power of architectural composition which results from the exercise of the student's natural capacity during the period of training.

Taking the exhibition as a whole, one observes that, although not very fully represented, the French National School is remarkable for two things, the attention given planning—that is, the effective disposition and proportion of the various elements of the composition and their co-ordination into a harmonious whole—and the attention given to draughtsmanship as a means of expression, always subordinate to the idea to be expressed and not as an end in itself.

An excellent example of this is seen in the set by Mr. Henri Defrasse, illustrating his scheme for a "Floating Island in the Atlantic." The general idea is well shown in the large coloured perspective, with its subtle harmony of blue-green and purple. But the detail drawings in black and white are perhaps even more interesting, with their impression of colour and distance and suggestion of the architectural features of the decorative treatment which is worth studying.

The work sent by the Ecole Nationale des Beaux Arts, in Rooms 3 and 4, represents the two classes into which the school is divided, the Second and First Class, which may be taken as roughly corresponding to the first and second, and third and fourth years of the English school programme. There are also some examples of work for the *Grands Concours* which represent the "post graduate" course of other schools, and include such prizes as the Chenevard, Rougevin, Godebœuf, Labarro, Prix des Architectes Americans, &c. For the last-named M. Aublet shows a fine plan for "A Sanatorium," worked out in considerable detail, and also illustrated by a section and elevation.

For the *Concours Godebœuf*, M. Labbe shows a detail which is worth studying both for its harmonious proportion and careful rendering. Two *esquisses* for a "Grand Stand on a Racecourse," by MM. Labatut and Cazalis, are excellent in their clever indication of the essential features of the design in a rapid sketch, and a good design for a bridge, by M. Mendelsohn, reminds one of a similar subject in a Rome Prize competition of recent date. In the Second Class, in Room 3 (showing the most elementary work and the *projets de construction*) there is a good set for a *Caserne de Sapeurs-Poupiers* with a well-schemed plan and simple elevation. Two construction subjects, "A Diorama" and an "Open-air Swimming Bath," should be noticed. There are also one or two good decoration compositions and some excellent *projets d'archæologie*, including one from the Strasbourg Regional School.

Some of the most interesting work in the exhibition is that sent by the Technical College at Delft, in Room 2. Here one is struck at once by the modern note and by the vitality of the school; study of the past is allied to practical considerations of the present, and the working drawings are capable and business-like studies of interesting problems in design, treated with imagination and originality.

This is well exemplified in Mr. L. Van Straatin's

set for a "Sea-side Casino," which really looks like a casino, and has been given an interesting silhouette which suggests the sea front with ts wide open space.

The Towers, by M. J. Van der Steur, is also an excellent study and has an effective grouping of the subordinate features leading the eye upwards to the central mass.

The many good designs shown in the portfolios should not be missed, as they are all interesting and well drawn, and mention should be made of the one or two examples of measured work which are well drawn and rendered.

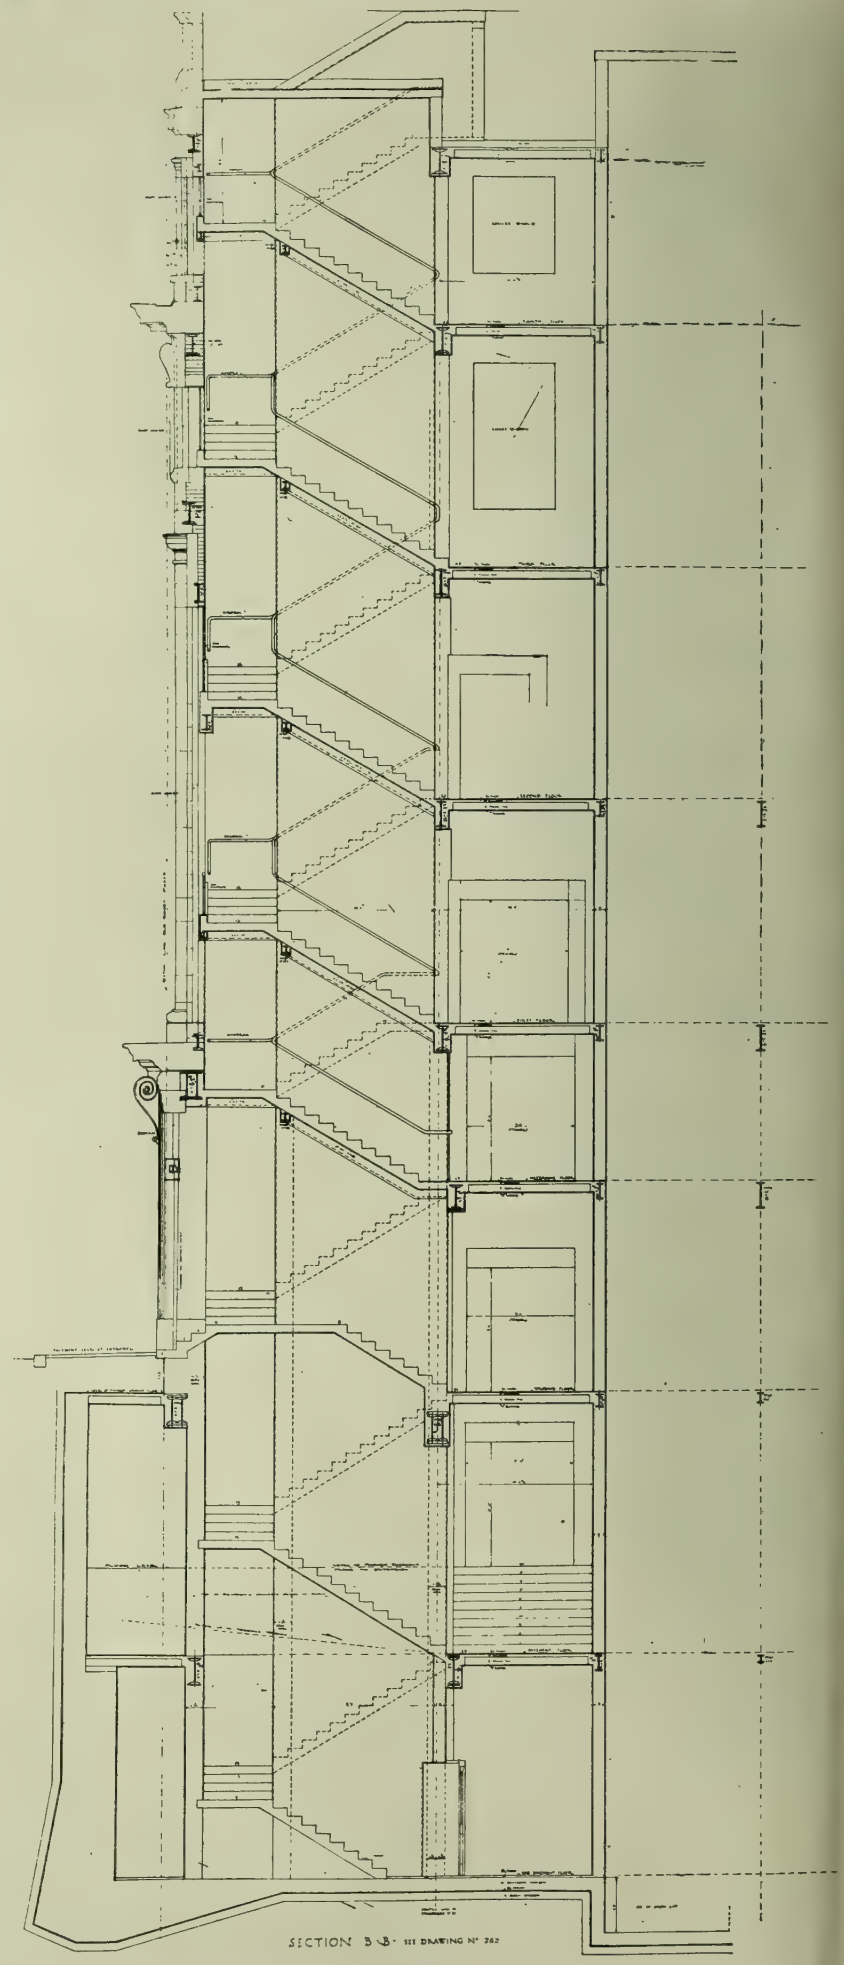
In Room 1 the most interesting exhibit is that sent by the Austrian schools—The Academy of Fine Arts, Vienna, the Technical High School, Vienna, and the Technical High School, Graz. Here the German influence is well marked, but there is considerable originality in the reproductions of sketches and models sent by the Vienna School. All these have the characteristic of visualising architectural design in the solid, and the skilful use of timber construction to obtain an unusual effect with a touch of the bizarre in the design, by Herr Langer, for a "Farm House in Franconia," should be noted. There is also a clever study of a wooden screen with a rich colour effect, by Herr Mengelhart

The remaining exhibits in Room 1 illustrating the work of students in the Royal Academy of Fine Arts, Copenhagen; the Royal Academy of Arts, Stockholm, and the Polytechnic of Norway Trondbjem, are disappointing, and do not call for special notice. The exhibits are for the most part small sketches, and do not show much architectural knowledge or ability.

In the Entrance Hall, however, there is a good show of work from two of the schools of Italy—the Royal High School of Architecture, Rome, and School of Architecture, Milan; in the latter case the exhibits are mostly small scale reproductions, but they are well worth studying, and show ability in composition and interesting detail—this is especially the case in Sig. R. Moretti's set for the "Headquarters of a Touristic and Sporting Association."

In the exhibits from the High School of Architecture, Madrid, one is attracted by a delightful water-colour sketch of a Romanesque church, and an excellent study with a fine plan, by Senor L. Bravo, "Proyecto de Eremita para S. Isidoro"; this design is illustrated by a delicate and beautiful rendering. There are also some good measured drawings, while on the opposite wall in Room 6 is a collection of excellent student's work from the Polytechnic at Budapesth.

BOOK REVIEW



National Housing: A Proposal for a National Municipal House Building Service, with an Examination of the Housing Bill, 1924. By MAJOR HARRY BARNES. (London: Ernest Benn, Ltd.) Price 2s. 6d. net.

This little book begins with the paper read by the author before the R.I.B.A., on March 27 last, with the comments of the four principal contributors to the subsequent discussion. It then proceeds to an examination of Mr. Wheatley's Housing Bill, and gives housing data taken from the report of the Building Industry Committee, concluding with a table showing the maximum housing charges per annum on the Exchequer and local rates. The book is, therefore, a handy little reference work that includes under one cover the arguments for National Housing, and the author's main objections to Mr. Wheatley's Bill. He has the laugh over the Minister when he speaks of the "cohesiveness of the holy combination" between employers and employed.

Annual Prize Distribution.

On Friday last week, Mr. H. S. Goodhart-Rendel (President) occupied the chair at the annual prize-giving of the Architectural Association, at 35, Bedford-square, W.C. 1, when the Right Hon. Winston Churchill was the principal guest and Mrs. Winston Churchill distributed the awards.

In opening the proceedings, the President said every year which passed since the war was a very important landmark in architectural education, because systematic architectural education in this country was on its trial. Until the beginning of the twentieth century England stood alone in having no systematic architectural education; there were evening classes, but most young architects got their experience from the blood of their first clients; they paid money to be in someone else's office and picked up what they could, which was generally precious little. The object of the school system was to make a sort of fool-proof training, which at the worst could only produce mediocrity but at the best could bring out the very best that was in a man. Opponents of academicism said school training checked genius, that it built up a hedge all round a student which he could not get outside; but he maintained that the kind of genius who could not get through any academic hedge was better kept under. They were trying to get a really good jumping-off ground for everybody entering the profession, and he thought every year was producing better results, and would go on producing better results until in times of adversity and times when perhaps there might not be available such inspiring teachers as the A.A. was fortunate enough to have at the present time, the system would go on without a break.

Mr. Winston Churchill said there was no doubt whatever about the importance of architecture and structure and their influence on human character and action. Take, for instance, the House of Commons. The whole character of British Parliamentary institutions depended upon the fact that the House of Commons was oblong and not a semi-circular structure. There would be no party difficulties at the present time if the House of Commons had been an amphitheatre, as were nearly all the American and Continental models. In a chamber of that shape every shade of opinion found its exact sector, and members could move from the most extreme left to the most extreme right without a single shock, without a violent transition of any kind, but by a series of most beautiful gradations of political thought. But, owing to what might in the long run turn out to be a fortunate accident, the House of Commons was oblong, and it had a gangway up the centre, which constituted a considerable, though not necessarily impassable, abyss, on each side of which political opinion was grouped in more or less extreme and organised forms which in proportion as they were extreme diverged farther and farther from reason and from the exact requirements of individual opinion. They made their buildings, but afterwards the buildings made them—their buildings regulated the course of their lives. Referring to the housing question, he said the old methods of building had fallen into the control of various restrictive processes, for which both capital and labour had their share of responsibility, and from which the general public was suffering at the present time. But new methods were coming along, and he had recently seen models of a system of building cottages of steel and timber which was claimed to be both cheaper and quicker than the usual methods. That was an illustration of the fact that when the needs of a community were blocked and barred by some obstruction it was certain that human ingenuity would find a new outlet. He had no doubt whatever that in the near future new methods of cottage construction would increasingly compete with the older methods. It seemed to him that one of the most essential impressions which a course of architectural education would have on a student would be in regard to the care of details, which was the maxim on which the great German military machine was built up, and which would carry its application into other spheres of life. From their studies they would also derive the idea that art and utility were not separate schemes of thought, that they belonged to the same unity, and that nothing should appear in a structure which had not some practical serviceable use. There they would find contact with the rudiments of logic and the rudiments of argument, where it was taught that one should never use more arguments than were necessary to prove a case. If the whole scheme of a building or an argument were known from the beginning, if the whole thing had been envisaged as a whole and not merely picked up step by step, an excellent case, or an excellent building, would result as easily as pouring water out of a jug. There was no excuse for opportunism in architecture. Another valuable acquirement they would derive from their studies was a sense of proportion. Everything in life depended upon proportion.

The prizes and studentships were then distributed by Mrs. Churchill.

In proposing a vote of thanks to Mr. and Mrs. Churchill, Mr. Robert Atkinson said it had been stated that new methods of building could not long be delayed, and he believed that among the younger architects there were the men capable of handling these materials. Young architects would not be lacking in appreciation of new materials provided they were given the opportunity of using them. If 50 or 60 years ago architects had been trained as they were being trained to-day, and had the faculty of analysis which they were endeavouring to instil into the students at the schools at present, the housing problem would not be nearly so acute, because the problem would have been tackled logically and sympathetically many years ago. Housing might be called "political architecture," and factory building and some other of the activities of the architects could be classified under the same heading. It was well known that the bulk of the unrest at the present time was largely brought about by the bad working conditions in factories. Possibly the manufacturers were to blame, but so also were the architects of the past who had not insisted on the buildings being sanitary and providing the best possible working conditions. As they were now looking forward to a period of industrial activity in factory construction, the power of the architect in analysis and in foreseeing the future would have a very great bearing on the political outlook of a great many factory workers in the future.

Mr. Philip Tilden seconded the motion, and said politicians could help architects a great deal. First of all, architects wanted to be given chances to build great buildings in great places, to hang their pictures upon the walls of the public streets; they did not want any Tom, Dick, or Harry to be able to build anywhere at any time. Another thing politicians could do for architects was to save the old buildings which were being pulled down or which were threatened with demolition; because a building had been in existence for hundreds of years it became more beautiful in the eyes of the architect, not only for its intrinsic beauty but also for its associations.

The following is the list of prizes and studentships for 1924:—

Public School Entrance Scholarship (value £63): J. A. Ritchie (Charterhouse).

Open Entrance Scholarship (value £63): D. R. Burles (Municipal School of Arts and Crafts, Southend-on-Sea).

A.A. Essay Prize (value £10 10s.): R. F. Orfeur.

First Year Course: 1st prize ("Howard Colls" Travelling Studentship, value £15 15s.): H. H. Goldsmith; 2nd prize (books, value £5 5s.) L. H. B. Roberts; art subject (value £3 3s.): H. H. Goldsmith; general progress (books, value £2 2s.): H. Cholmondeley.

Second Year Course: 1st prize (A.A. Travelling Studentship, value £26 5s.): J. Breakwell; 2nd prize (books, value £10 10s.): W. R. Brinton; Hon. Mention: C. Green and J. V. Hamilton; art subjects (books, value £5 5s.): J. Breakwell; Hon. Mention: Miss N. Nickalls; general progress (books, value £3 3s.): D. C. Saunders; scholarship tenable for one year in third-year course (value £63): C. W. Sully.

Third Year Course: "Holloway" Scholarship, tenable for two years (value, £300): D. H. Beaty-Pownall; 1st prize ("Henry Florence" Travelling Studentship, value £50): R. C. Erith; 2nd prize (books, value £21): W. E. Trent; 3rd prize (books, value £15 15s.): Mrs. B. S. H. Fisher; general progress (books, value £5 5s.): E. F. Goldsmith; "Alec Stanhope Forbes" prize for best colour work during the year (books, value £5): R. C. Erith.

Fourth and Fifth Years: Design: 1st prize (value £6 6s.): E. W. Lewis; 2nd prize (value £4 4s.): Miss A. Sleigh. Town-Planning: 1st prize (value £6 6s.): Miss E. Moseley; 2nd prize (value £4 4s.): T. S. Barnes. Construction: 1st prize (value £10 10s.): Divided, Miss E. Scott and Miss E. Meikle. Decoration: 1st prize (value £6 6s.): E. W. Lewis; 2nd prize (value £4 4s.): F. E. Bennett.

Architectural Association Diploma: T. S. Barnes, R. E. Enthoven, L. R. Hiscock, J. K. Parker, W. Percik, G. W. Silk, Miss E. Scott, Miss J. E. Townsend.

The following students qualified for the Diploma, subject to completion of six months' office experience: H. Braddock, G. G. Grant, Miss A. F. Jones, Miss E. Meikle, Miss E. Moseley, D. F. Martin Smith, H. A. Pakington.

Medal presented annually by the Société des Architectes Diplômés par le Gouvernement to the best Diploma student of the year: R. E. Enthoven.

R.I.B.A. "Henry Jarvis" Scholarship (value £50): J. W. Wood; Hon. Mention: F. L. Preston.

Architectural Association Measured Drawing Prize (value £10 10s.): H. H. Goldsmith.

A.A. Design Club Prize (value £5 5s.): G. H. R. Heritage.

Architectural Review Prize for the best holiday sketch and sheet of details (value £5 5s.): Divided, W. R. Brinton and C. E. Green.

Architecture and the Eisteddfod.

At the Welsh National Eisteddfod, to be held in August, at Pontypool, it has been decided that the subject of discussions to be introduced at the meetings of the Honourable Society of Cymmrodorian shall be "The Teaching of Art and Architecture in Wales." At the initial meeting the president will be the Right Hon. Lord Treowen, and the Lord Bishop of St. David's will preside at the second session. Amongst those who are to take part in the debate are Sir W. Goscombe John, Sir George Frampton, Dr. Mortimer Wheeler (director of the Welsh National Museum), and Messrs. T. Alwyn Lloyd, W. S. Purchon, A. Trystram Edwards, and D. Lleufer Thomas (chairman of Welsh Development Association).

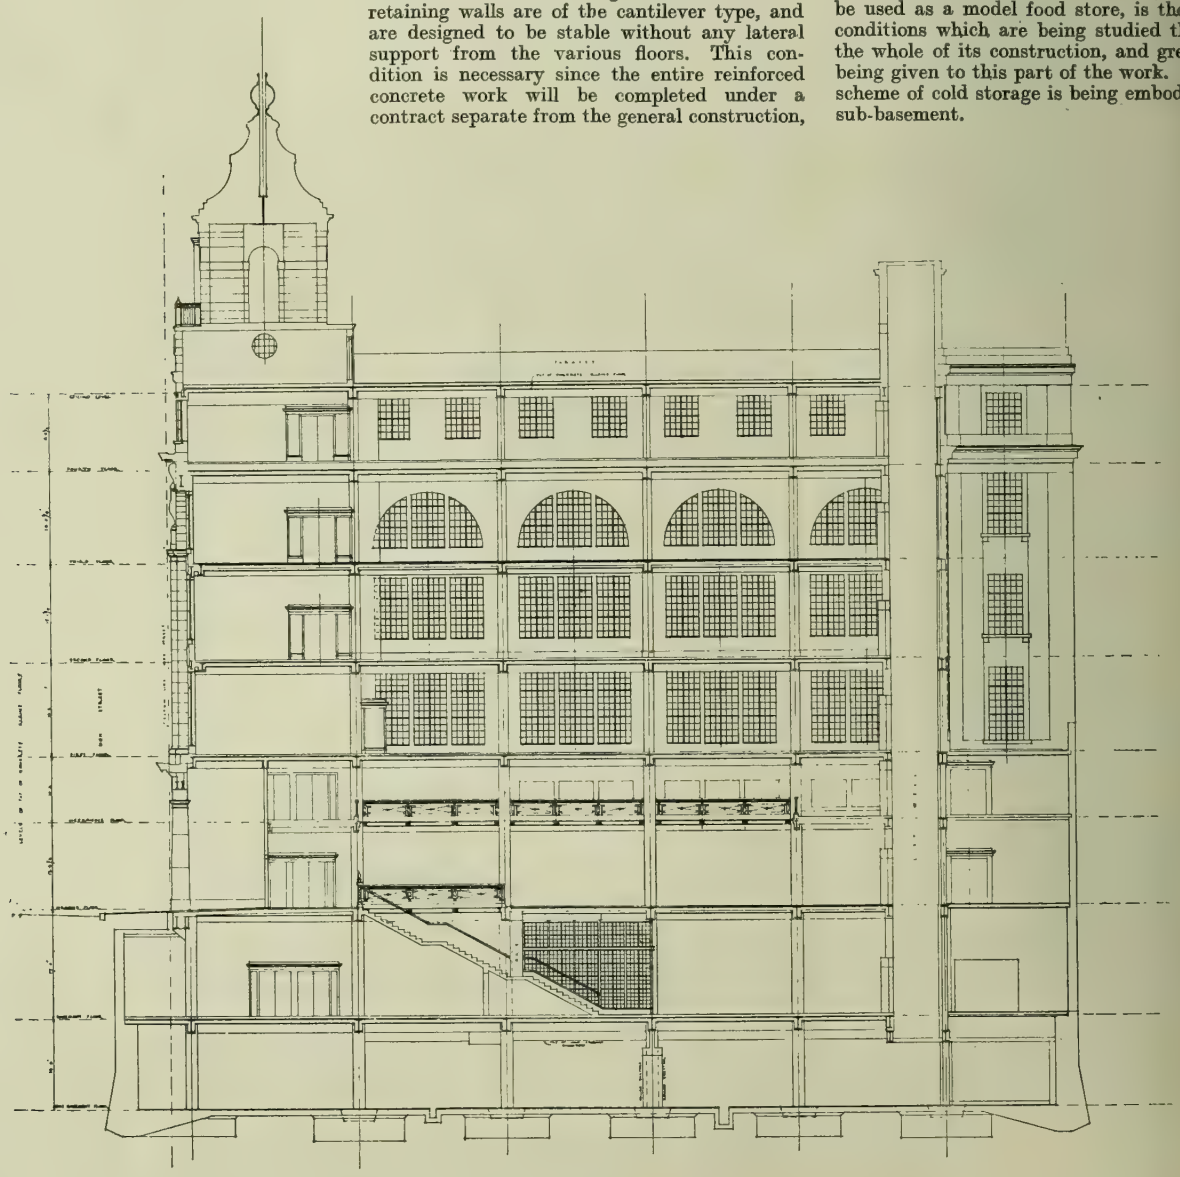
Liverpool Cathedral.

The view of the interior of Sir G. Gilbert Scott's Liverpool Cathedral is referred to on p. 157.

Messrs. John Barker's New Premises.

The façades of the new premises now being erected for Messrs. John Barker & Co., Ltd., in Kensington High-street, have been designed by Sir Reginald Blomfield, R.A., the remainder of the architectural work being carried out by Mr. H. L. Cabuche, O.B.E., F.S.Arc.

The foundation work is being carried out in two sections: (1) A retaining wall and raft over the site, for which Messrs. P. & W. Anderson are the contractors; and (2) reinforced concrete work carried out by Messrs. Considere Constructions, Ltd.

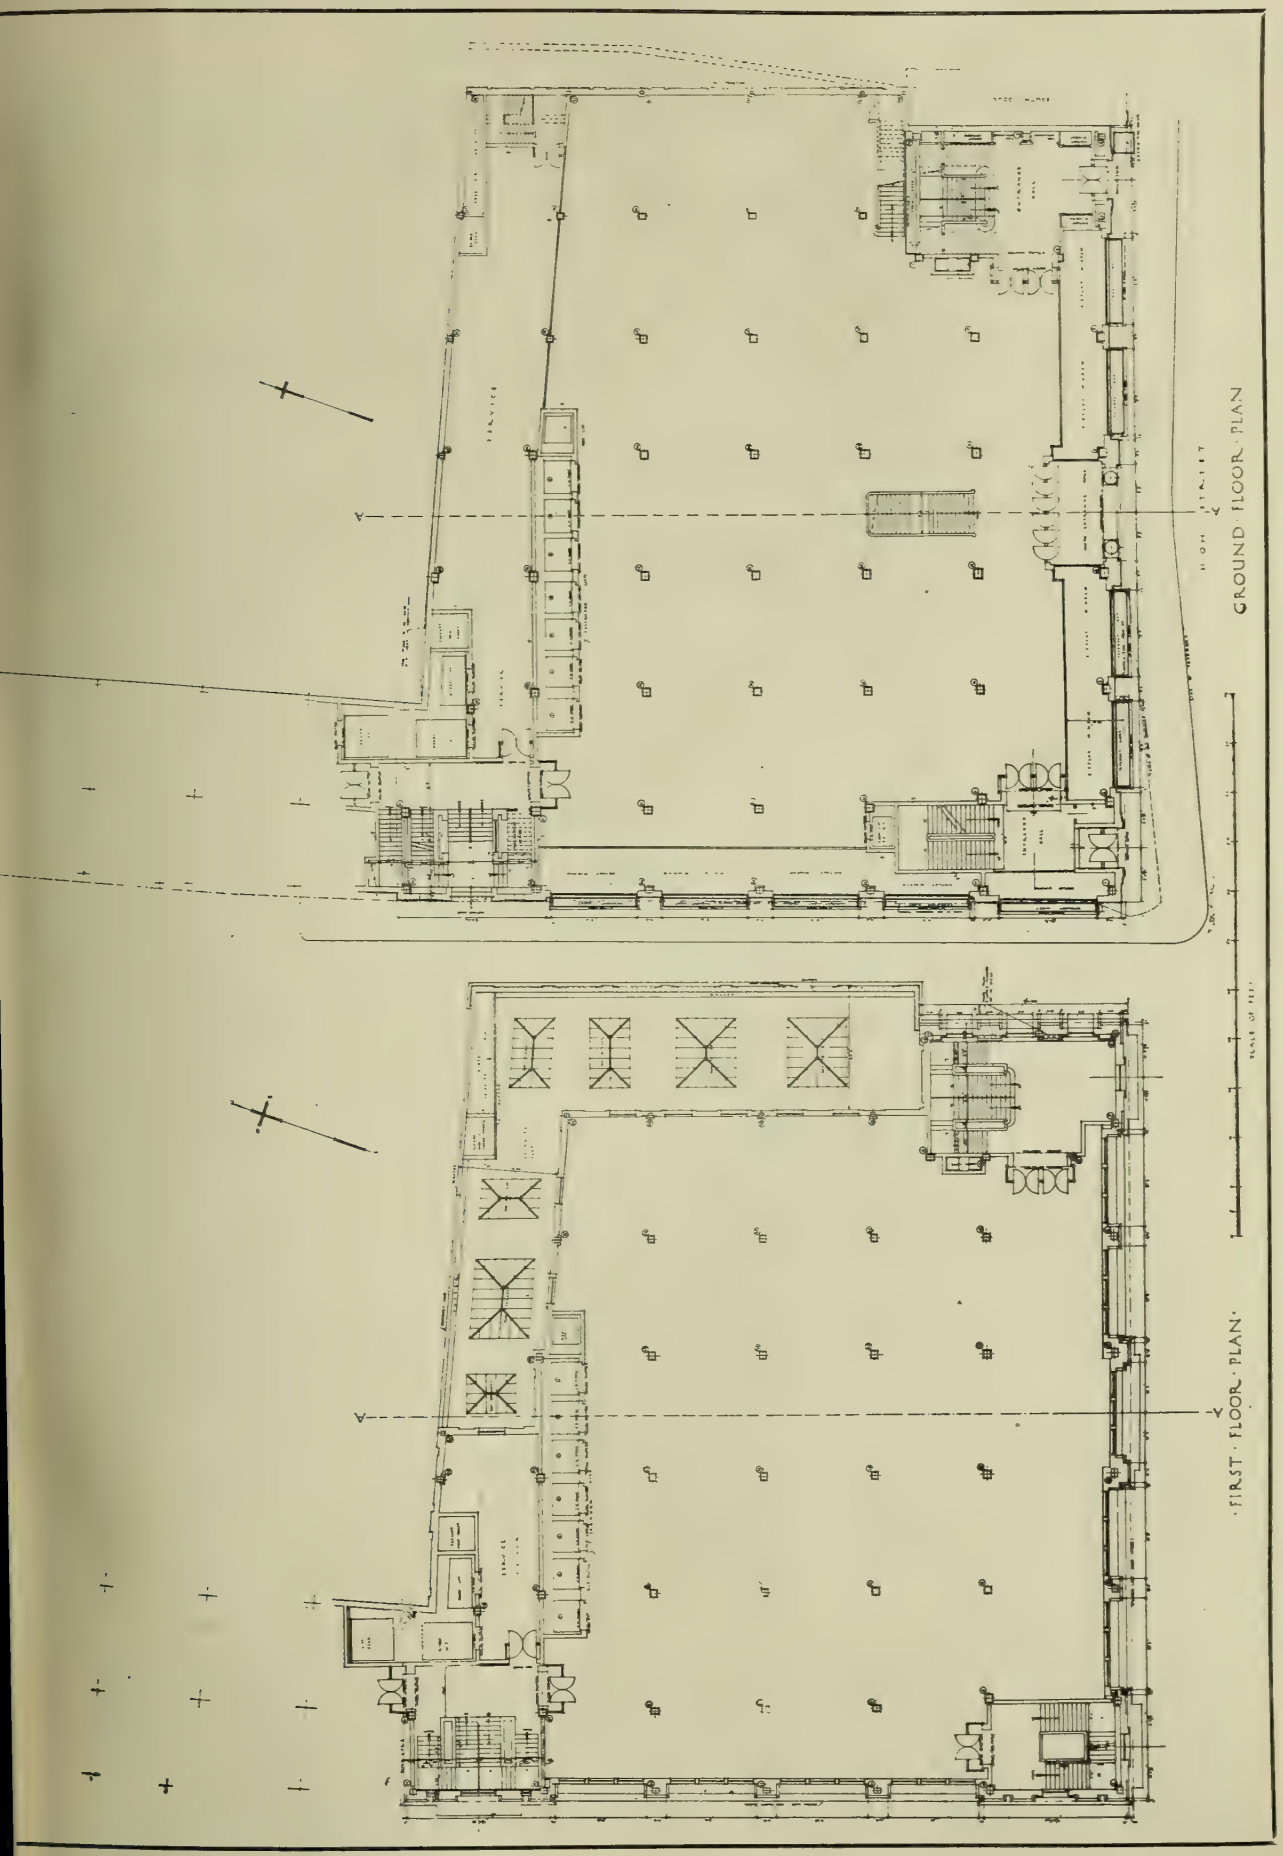


The total height of the external retaining walls is 31 ft., with a maximum excavation depth below ground of 35 ft. The horizontal thrust given by the earth and retained by these walls amounts to a total of 4,000 tons. The reinforced concrete wall has a maximum thickness of 3 ft. 6 in. at sub-basement level, diminished to 18 in. at ground level. These retaining walls are of the cantilever type, and are designed to be stable without any lateral support from the various floors. This condition is necessary since the entire reinforced concrete work will be completed under a contract separate from the general construction, and may, therefore, be completed before the floors have been constructed.

One of the principal difficulties to be contended with in the design of this work is the presence of water, which percolates at various heights and has a hydrostatic head above the basement level of 5 ft. This gives an upward pressure on the whole of the reinforced concrete raft of 3,500 tons, and the reinforced concrete raft slab and column bases have been designed to resist this upward pressure. In addition, the raft slab and column bases have to withstand very heavy column loads, amounting in some cases to 612 tons. The total amount of earth to be excavated in order to construct the above work is 36,000 cub. yds.

The steelwork is in the hands of Messrs. A. D. Dawnay & Sons, Ltd.; stonework by Messrs. F. J. Barnes, Ltd.; floors by Messrs. Kleine Flooring Co., Ltd.; lifts by Messrs. Waygood-Otis, Ltd.; heating and ventilating by Messrs. Jeffreys & Co.; asphalte by Messrs. Limmer & Trinidad Asphalt Co., Ltd.; casements by Messrs. H. Hope & Sons. A window of the "Austral" pattern is being introduced owing to its special facilities for ventilation.

Contracts for the remaining work will be placed in due course.



A special feature of this building, which will be used as a model food store, is the hygienic conditions which are being studied throughout the whole of its construction, and great care is being given to this part of the work. A special scheme of cold storage is being embodied in the sub-basement.

"The Forsaken."
[Bronze Group shown at the Paris Interna Exhibition of 1878, and awarded one c three medals given to Great Britai Sculpture.]

HE SCULPTURE OF ALBERT BRUCE-JOY

By P. H. DITCHFIELD, M.A., F.S.A.

art of sculpture has made wondrous
s during the last half-century. It has
the fashion of some modern critics to
verything Victorian, its art, its poetry,
nting and literature. While much of
ort of criticism is decidedly uncritical
cking in truth, bred of the bombastic
ces of lesser men who imagine them-
to be great geniuses, the brilliant mas-
f the arts of a new age of mighty
ment, nevertheless the hard words that
een said of the sculptors' art of mid-
nth century are more or less justified.
itor of the official guide of the Fine Art
s of the Exhibition of 1862, the late
Palgrave, of "Golden Treasury" fame,
d to sculpture as "the forlorn hope of
art," and could only grieve over the
in national taste, and the entire ab-
of that healthy severity and earnestness
it in which sculpture flourishes.
my privilege to write of one who has
ly lived through the period that marks
owth and survival of English sculpture,
ho has himself by his genius and skill
uted to the advancement of the art he
so well. The period of the professional
of the late Mr. Bruce-Joy was between the
1866 and 1916, but allusions have been
to the colossal statue of Queen Victoria,
e bust of Lord Morley and a few other
as they have been brought before the
since the latter date. A distinction
e drawn between the modern sculptor
reserves the academic spirit throughout
reer and those who prefer to rely upon
their own individuality. The latter are the more important class, and to this class certainly belongs the name of the subject of this appreciation, Mr. Albert Bruce-Joy. His individuality is shown in all his works. Undoubtedly it may be said that he is one of our best-known sculptors, and his works have been exhibited and placed in all parts of the Empire and in America.

The late Albert Bruce-Joy.

Mr. Bruce-Joy was born in Dublin in 1842 and thus it will be seen that the artist reached the advanced age of fourscore years. He came of Huguenot stock. In 1612 his ancestor sailed from Barnstaple in Devon to Ireland, Captain Thomas De Joye accompanying Sir Arthur Chichester, the ancestor of the Donegal family, and settling in county Down. Francis Joy in 1737 was the founder of the *Belfast News Letter*. His father, Dr. W. Bruce Joy, was a brilliant physician and scholar, very learned in his profession, and towards the end of his life Senior Member of the Royal College of Physicians in Ireland, and one of the most prominent writers on medical subjects. His mother's maiden name was Vance, the chief representative, with her brother Patrick, of the Irish branch of the de Vaux family of Baux Castle, near Avignon.

Mr. Bruce-Joy was sent at the age of nine to the "Real Schule" where five hundred scholars were educated, at Offenbach, near Frankfort. After two years at this school he went with his family to Paris, where his studies were continued for about four years under a tutor. Returning to England, he was for two years educated by Dr. Hill—afterwards head master of Magdalen College School, Oxford—and then attended lectures at King's College. He manifested such a keen love of art and beauty that his parents sent him at the age of seventeen years to the Kensington School of Art, where he was successful in winning all possible prizes, including the National Medallion. In 1862 he became a pupil of the sculptor Foley, who had then risen to the height of his genius. Foley lived to see the advent of a new spirit, and his equestrian statues of Lord Hardinge and of General Outram in Calcutta were two of the earlier works to show a clear trace of the return to the observation of nature which was necessary if the English sculptors were to follow the lead given by the French School. He entered the Royal Academy Schools in 1863, but, beyond doing his probation work and attending anatomical lectures and those on architecture, he never did anything there, as Foley advised him to give all his time to his work, under his own supervision, during the four years, to modelling and carving in marble. Foley was a most conscientious teacher, and after a time he set his pupil to model and carve. Finally he began, in the clay, several of Foley's large statues, and also the heads, and thus gained much valuable experience. Foley tried to persuade him to attempt some original work, but the young sculptor was too diffident to do so for a long time, and was distrustful of his own powers. However, at last he modelled his first bust from Nature—"Sunshine." This work was exhibited in 1866 in the Royal Academy together with his group in relief, "Moses uplifting the Brazen Serpent." This bust is one of the best specimens of the sculptor's art, and is remarkable for the radiant sweetness of smile which lights up the finely cut features.

Still striving after greater perfection he went to Rome, where he spent three valuable years, studying from the antiques and in a life school. After this he went every year to

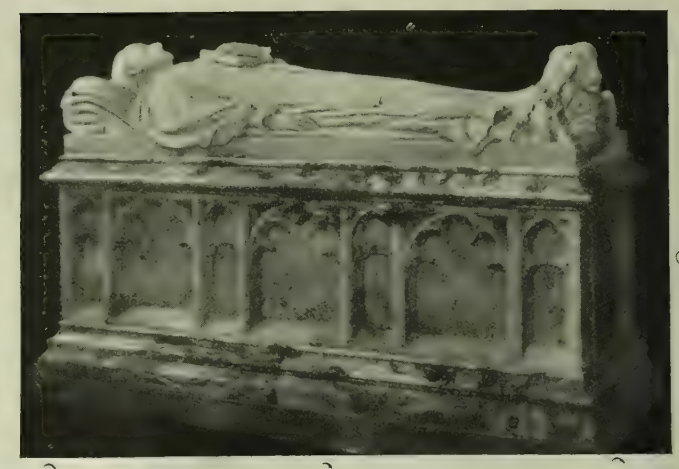
Columbia.]



"The First Flight."

[Shown in Plaster and in Bronze at the Royal Academy.]

Paris to see the Salon and other exhibitions, as well as his friends among the leading French artists and fellow students, spending much time in studying the finest work of the leading sculptors in France. As was his wont, he worked hard, and always made a point of exhibiting some of his sculptures in the Royal Academy every year.

And here I may record some of the extraordinary accidents that have befallen Mr. Bruce-Joy. Fate has not always been kind to him. In his third year in Rome he caught Roman fever (malaria) in a virulent form, which entirely stopped his work for two or three years. Nor was this his only misfortune. On one occasion, in 1895, when he was staying at Barbizon, returning home from the Forest of Fontainebleau in the dusk of a summer evening he was shot and severely wounded by a man who mistook him for a stag. He was in bed for three months, and on crutches for two years. How he escaped with his life is a mystery. Fate had still some arrows more to harass and impede his career. His studio at Hindhead was burned to the ground and much valuable work destroyed. A few years ago he narrowly escaped losing his sight. He was hurrying to his home and took a short cut through a hedge, when the sharp point of a holly leaf struck his eye. Inflammation set in, and only the skill of a distinguished oculist of the day saved him from blindness.

After his recovery from malaria he worked at producing medallions at Oxford, Cambridge and Dublin, slowly regaining his strength. Not long after he was invited to compete with other artists for the erection of a colossal statue in memory of Mr. John Laird, of Birkenhead, the first builder of steel ships. He sent in two models which were judged to be the first and second out of the sixteen exhibited. The statue is in bronze, and stands in Hamilton-square, Birkenhead. It was pronounced to be a perfect likeness and a wonderful work of art, and the artist had but one photograph, of the head only, to guide him. In the same year (1877) the "Dr. Graves" statue was unveiled in the Royal College of Physicians, Dublin, by the Lord Lieutenant, the late Duke of Marlborough.

Memorial to Bishop Berkeley in Cloyne Cathedral.

It was said to be a most admirable work, the likeness being very striking.

His medallion of the Countess Przezdziecka attracted attention at the Academy of 1869, and was specially commended for its delicacy and tenderness. His medallions in the Academy of 1871 were much admired and also an ideal statue of "The Young Apollo," of Keats' "Hyperion," was deservedly praised; of this the *Times* critic stated that "he has given a true and tender expression of sorrow to the conventional Greek mask of Apollo, and is very happy in the composition of the figure, which is original, and feelingly as well as gracefully modelled." Mr. Bruce-Joy, we may add, especially delighted in ideal subjects, although it was his fate to be called, mainly, to immortalise the figures of distinguished men.

The only occasion when Mr. Bruce-Joy ever again entered into competition was for the Tercentenary Memorial Statue of Harvey, when he was invited, together with two other sculptors (members of the Royal Academy) to send in a model. His sketch was chosen, and he produced a statue that is a fine work of art. It was said of it "the man was worthy of the statue, and the statue worthy of the man," and that it added another laurel to those already won by the artist. It stands at the end of Castle Hill-avenue, Folkestone, near Dr. Harvey's birthplace, and is of colossal size, in bronze, representing the discoverer of the circulation of the b in the dress of the perio Charles II, and wearing academic robe of Padua at anatomical school of w Harvey studied.

Mr. Bruce-Joy had the teresting experience of portra four generations of our R Family. He was the only o our sculptors whom our late Edward honoured with sit for any bust or statue. He a wonderful bust of His Ma for the University of Manche and no less than eleven re have been executed by him marble and bronze), and they stand in the following other sites: The Mayo Mem Hospital at Lahore, the P Palace at The Hague, the wich Memorial Hospital, the Chamber of Commerce, un by the English Ambassador Royal Chelsea Hospital, and the G Chamber of Commerce. The bust at La represents a part of the Great Memori King Edward VII, which was subscribe entirely in India. The late King himself delighted with this work.

A very imposing statue of Queen Vic thirteen feet in height, was made by Bruce-Joy for the Government of B Columbia. It is erected in front of the liament House in Victoria, British Colu and was unveiled by the Governor-Gene Canada in 1921. The last time I saw it in the Royal Exchange, London, where it deposited during the war until the seas open again for its travelling to its destin He also made a medallion of H.R.H. the Prince Leopold, Duke of Albany, befor death. In 1916 he was asked by H.R.H Prince of Wales to execute his statuet bronze as he appeared at the age of sixte the Carnarvon Coronation investiture Garter robes. This work is now in the session of H.M. the Queen in Buckin Palace.

It is impossible in this sketch to enum the vast number of works that have from Mr. Bruce-Joy's studio, but me must be made of the most important. most among them is the colossal statue o Gladstone that stands in front of Bow Ch London, East. It is in bronze, and i excellent likeness of the statesman, w

aid at the unveiling that "Seldom, if has the hand of a sculptor succeeded in cing so admirable and faithful a like- It seems to breathe the deep earnest- the dignity and intellectual power of the man whom we used to call the "Grand Ian."

ningham quickly followed the lead of n, and John Bright became his next Mr. Bright was greatly pleased with atue of himself, and when Manchester l to commemorate him Mr. Bruce-Joy gain chosen as the sculptor, and this stands in front of the Town Hall. A marble statue of Bright by him is in the of Commons.

less successful is the fine portrait bust late Marquess of Salisbury in London's on House, in marble. It is an admir- ikeness, and was presented to the City e Lord Mayor and Corporation. In the Office is this artist's memorial bust of te Sir Robert Montgomery, G.C.S.I., ., and in the library of the House of ons is a noble bust of Lord Farn- h, better known as Sir Thomas Erskine for many years the Clerk to the House. e Speaker said at the unveiling, "the of the artist has managed to stamp the marble something of the spiritual gence of his subject." Additional interest en to this bust by the fact that Sir rick Leighton, P.R.A., was the artist er on the Committee, which consisted of Members of the House of Commons. es these we find in the Law Courts and ncoln's Inn the memorial busts of Lord s.

Bruce-Joy is well known in America. ust of Senator Chauncey Depew is in the Club, New York; that of Mr. Frederick ver, of New York, so well known in ca and elsewhere, and of the Hon. Loudon len (formerly Ambassador to Greece and , in Philadelphia, and the colossal marble part of the monument to Dr. J. C. Ayer l, near Boston. This monument also s of an ornamented sarcophagus of , weighing in all 30 tons. Mr. Bruce- ad twice toured America and Canada. l of his works were shown at the In- onal Exhibition at New Orleans, , in 1885. He also made a medallion Hon. Whitelaw Reid, the late Ameri- mbassador, and of Lieut. Andrew t,* U.S.A., in bronze, which is in the States ship of war, the "Sterrett." v mention also the medallions of n Miller, the Californian poet, and

*t. Sterrett distinguished himself in fighting the Tripoli pirates more than a century ago.

The Harvey Tercentenary Statue, Folkestone.
[A colossal bronze statue unveiled in 1881 in the presence of The International Medical Congress.]

Frank Griffin, of the *Cosmopolitan Review*, New York. Also a medallion of Mark Twain done from a sitting on his last visit to England.

Other notable examples of Mr. Bruce-Joy's work are mentioned in the following brief list: The Sir Humphry Davy medal, executed for the Royal Society, and given in the form of a medal annually; the Dr. Longstaff medal, executed for the Chemical Society of England; the Professor Malden medal, executed for University College, London; medallion of the late Sir Frederick Burton, Director of the National Gallery; Oscar Browning, of Cambridge; Sir George Gabriel Stokes, F.R.S.; General Sir Edward Hutton, K.C.B., K.C.M.G., late Commander-in-Chief, Australia; Archdeacon Palmer, Christ Church, Oxford; Professor Max Müller, Oxford, bronze bust and medallion; Frederick Locker-Lampson, the poet; the Rev. Canon Hamilton, D.D.; Mrs. Scott Siddons; Percy Fitzgerald, the author; the Rev. Humphrey Lloyd, D.D., Provost of Trinity College, Dublin, marble bust; Rev. Dr. Phillips, President of Queen's College, Cambridge; Sir Richard Jebb; Dr. Hill, Headmaster of Magdalen College School, Oxford; monument of Sir William Siemens, F.R.S., near the memorial of the artist's father in Kensal Green Cemetery; the busts of George Meredith and Joseph Chamberlain, and a small silver statue of the Maharajah of Nepal; the memorial bust of John Couch Adams (the astronomer), in St. John's College, Cambridge; the Cranmer Memorial in Jesus College, Cambridge.

As I have said, Mr. Bruce-Joy rejoiced more in ideal work than in portraiture; though, as a very popular sculptor, he had been in great demand for the latter. One could almost wish that he had had more time for indulging in his imaginative creations, but those that he had accomplished were very charming. I have already mentioned one of his earliest, "Sunshine," and also "The Young Apollo," and his earliest of all, "Moses and the Brazen Serpent." A very important one is "The Forsaken." The subject is taken from Bürger's ballad, "The Rose of Taubenhayn." A forsaken and betrayed mother, in a fit of insanity, has killed her babe by stabbing it with the pin that held her hair. The moment chosen is when the mother has just awakened to consciousness and sees her murdered infant lying beside her, exclaiming "Jesus, my Saviour, what have I done?" The incident is depicted with much dramatic force, and the agony and despair of the mother form a striking contrast to the almost smiling face of her babe. For this piece of sculpture the artist was awarded one of three medals

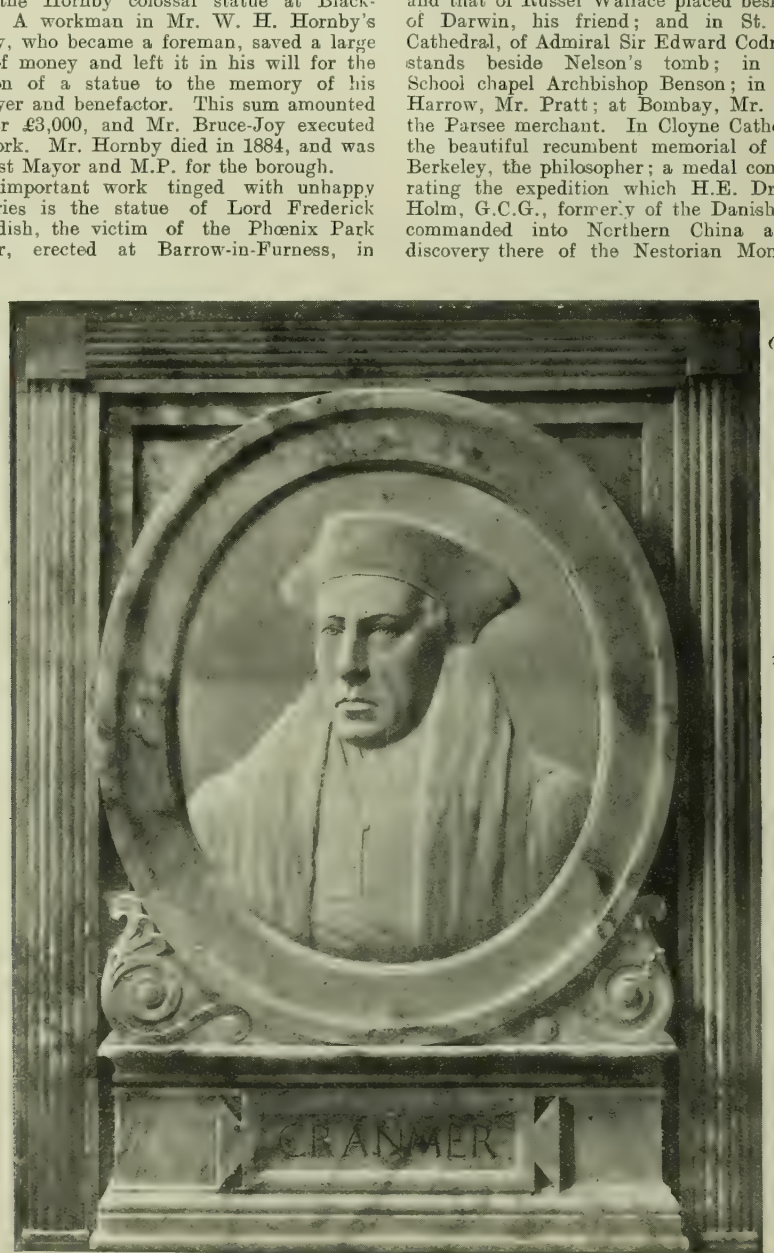
granted to England at the great Paris Exhibition of 1878, the other two being awarded to Sir Frederick Leighton, President of the Royal Academy, and Sir Edgar Boehm, R.A.

A very delightful ideal work is "The First Flight," representing a life-size figure of a young girl holding in her left hand a nest of young larks, while with her right, raised over her head, she offers its liberty to one of the nestlings poised on two of her fingers. It is a very fine example of poetic sculpture. It was exhibited in America with other works, and was shown in plaster at the Royal Academy and afterwards in bronze. "The Pets" is a portrait study of the young daughter of the late Mr. Thomas Moss, of Liverpool, and represents a beautiful child with her favourite dog. "The Fairy Tale" is a life-size statue of a girl reading a story-book, a daughter of Lord Cranbrook.

Mr. Bruce-Joy made a speciality of athletes, and besides his statuette of Mr. C. B. Fry, the famous cricketer, he has executed a statuette of Mr. Seligman, for many years the champion fencer of England, and one of Mr. Eustace Miles, a former tennis champion, and a much admired "Boy Scout," and others. An interesting history is connected with the Hornby colossal statue at Blackburn. A workman in Mr. W. H. Hornby's factory, who became a foreman, saved a large sum of money and left it in his will for the erection of a statue to the memory of his employer and benefactor. This sum amounted to over £3,000, and Mr. Bruce-Joy executed the work. Mr. Hornby died in 1884, and was the first Mayor and M.P. for the borough.

An important work tinged with unhappy memories is the statue of Lord Frederick Cavendish, the victim of the Phœnix Park murder, erected at Barrow-in-Furness, in bronze, a very fine work, both dignified and impressive. A marble statue of heroic size stands in Liverpool University Buildings to the memory of Christopher Bushell, who wrought great service for the cause of education in that city. I must not omit to mention the very fine colossal statue of Lord Kelvin, executed in the year before the war, which stands at the entrance of the Botanic Gardens in Belfast, and which was shown at the Soirée of the Royal Society, London, in that year—in spite of the great weight of the bronze, which made it necessary to prop up the floor where the statue stood. The memorial statue in marble of Lord Justice Fitz-Gibbon, unveiled in the summer of 1914, in St. Patrick's Cathedral, Dublin, is placed close to this artist's statue of Chief Justice Whiteside, the very distinguished Irish Judge. And also in St. Patrick's Cathedral is the memorial of Dr. George Salmon, the great mathematician. The very charming and important marble representation of the beautiful Miss Mary Anderson as "Galatea" is in the Shakespeare Memorial at Stratford-on-Avon. In Canterbury Cathedral is his fine marble medallion of Dean Farrar; in Westminster Abbey his memorial of Adams the astronomer; and that of Russel Wallace placed beside that of Darwin, his friend; and in St. Paul's Cathedral, of Admiral Sir Edward Codrington, stands beside Nelson's tomb; in Rugby School chapel Archbishop Benson; in that of Harrow, Mr. Pratt; at Bombay, Mr. Wadia, the Parsee merchant. In Cloyne Cathedral is the beautiful recumbent memorial of Bishop Berkeley, the philosopher; a medal commemorating the expedition which H.E. Dr. Frits Holm, G.C.G., formerly of the Danish Navy, commanded into Northern China and his discovery there of the Nestorian Monument, was exhibited in the Royal Academy last year.

Mr. Bruce-Joy had many distinct besides the general recognition of his tal and genius. For the International Colle of Numismatics shown in the great Bru Exhibition of 1910 he was appointed to re sent England on the foreign committee, in 1913 he represented this country on International Jury for Numismatics at the hibition of Ghent. In 1896, at the P Salon, he was given the only award for h in that year when he exhibited the fine of the Marquess of Salisbury, to which I referred, and a very striking one of Balfour Fergusson, of Dundee. In 188 the Antwerp Exhibition, he was appointe Lord Salisbury, then Prime Minister, as only representative for Great Britain on International Jury, when both painting sculpture were under his charge.



The very large number of important w exhibited by him at the Royal Academy the Paris Salon during his long professi career, dating from 1866, proclaim his ar ing industry as well as his genius. Amo other honours he was appointed Corresp ing Member of the Royal Academy of To Spain.

One of the secrets of his success that source of all gifts—a true and living stinct as to the character of those whom portrayed, and a quite marvellous power giving life and animation to the features. expert once said about him: "The thing we cannot tell the cause, but this circ stance does not lessen one's pleasure in effect—when that is superlatively good, thus we can be content to leave it a mys as to how Mr. Bruce-Joy contrives to m his statues live in their eyes as much as oil-painter has ever contrived to do canvas." More than thirty years ago sculptor built his house in the beautiful re of Hindhead. Two examples of his work w being exhibited last year (1923) in the R Academy, as well as some in the Paris Sa He could reflect on a long life of great acti and success, of wonderful achievement, of tercourse and companionship with the grea and most illustrious men and women of age, of those who looked

"Beyond this strange disease of modern
With its sick hurry, its divided aims.
Its heads o'ertaxed, its palsied hea
and strife,"

to find at length the City Beautiful.

And therewith he was content, recoll ing all the changes and chances of this mo life, his triumphs, his trials and vicissitu and happy memories.

South Wales Institute of Architects.

The South Wales Institute of Architects the South Wales Institute of Builders held combined summer meeting recently. rendezvous was Pencoed Castle. The p included Messrs. A. Gibson, Percy Thomas S. Purchon, and A. W. Julian, from the Ca area, and Messrs. A. Jenkins, Col. Fawckner W. Parfitt from the Newport centre. Afte inspection of the Castle buildings Mr. J. Fletcher, Newport, delivered an address o history, tracing its development from the British settlements through the Norman pe to its greater building in the boom days follo the Wars of the Roses until the present structure was erected in the Tudor pe Considering the number of Tudor mansions i district, he said, it caused one to wonder v builders of those days got so ready a supl labour. Mr. Percy Thomas proposed a vo thanks to Mr. Fletcher, which was carried

RCHITECTURAL EDUCATION CONFERENCE

THE WORK OF THE SCHOOLS

The Architectural Association School.

By A MEMBER OF THE A.A. STAFF.

HEN a member of the teaching staff of an itectural school writes of the work of that ol he lays himself open to charges of bias, even to the more heinous crime of what Americans call "boosterism." Safety ld seem to lie in a mere detailed description he works exhibited at Devonshire House, little result would be accomplished, for the true way to gather a true and full impression building or a drawing is to go and see it for self. The aims of teaching can, however, set down in writing, with some indication hose sections of the work in which such aims most clearly exemplified.

is a truth, scarcely controvertible, that no unt of influence and pressure can create large group of students an artistic expression ch is not somewhere latent in the mass sonality of that group. Architecture is the ression of a human idea, of a creation arising a problem and evolved from the per- lity of the person who is dealing with that blem. Given a human being who has been ght up amid certain conditions, and who been moulded not only by inherited ten- cies, but by exoteric influences of present-day lisation, you will find a field ready for ivation, and in which will flourish that kind rchitectural growth most native to its soil. ne of the main tasks of teaching, therefore, bring out and develop natural thought and ression, and cause to bear on them the lessons xperience, so that the development will be only humanly natural, but of a nature guided logic. Many of us feel to-day, in architec- l creation, an inward urge towards an itecture which has its roots in the past, which definitely expands and develops in direction of fresh forms and fresh ideas ing from fresh problems and fresh tech- l methods of solving them. We feel that ect to tradition is best served by adopting litional forms in those types of buildings ch have scarcely changed in function, and refore logically in expression, throughout the ier periods of history. But to attempt to row and imitate, to twist and alter old forms, h the desire to subject them to new uses for ch they were never created, is gradually to respect for the beautiful through a subtle cess of degradation and vulgarisation. aim of the system of teaching, therefore, is ake the modern human personality, and train t personality to create a modern architecture. the accomplishment of that process the ool plays an important part, but it can only im, or claim to hope, that it sets the students' ps firm on the right road.

n the effort towards this end a system or hod of teaching gradually evolves, imperfect ever modified as experience is gained. method is composed of an atmosphere, the osphere of the School, and direct detail ruction, the results of which are seen im- liately in drawings produced. The less gible atmosphere will be absorbed, and in r practice will form the basis of subconscious uises in architectural design. Perhaps only ome ten years' time will one see the true lts.

o judge of the drawings is not so difficult. e are ready comparisons, and obvious ments on technique, power of composition, tructional ability, acquaintance with the t architecture of the past. At Devonshire se we see the scheme set out. Only a few year drawings, a wider range of second-year ies, and then a fuller selection of third, fourth fifth-year designs. More of these have been n because the interest of a school lies in ence of its tendencies in design and of uate preparation towards a technical equipment; and in the later years also there is the added interest of the approaching period of office work and ultimate practice.

The Architectural Association believes in construction and in working drawings. Not in the preparation of show plates or "Snyder's Details," but in drawings which describe and explain the job. The small house problem forms a complete constructional text-book in itself.

The course which a Diploma Student follows in the Architectural Association Schools is best exemplified by examining the exhibition series of the work of one student throughout the school. Mr. R. E. Enthoven's work is above the average in quality, perhaps, but not in range of subjects. Space forbade the exhibiting of all his drawings; but even if those shown were fully representative, one may experience pardonable pride in this accomplishment. One feels that at the lowest appreciation there is evidence of a step forward from previous educational methods and every ground for confidence in the future in the Architectural Association's organisation of a school for architects governed and directed entirely by architects.

The Liverpool School.

By PROFESSOR C. H. REILLY.

THE School of Architecture of the University of Liverpool was founded in 1894 and is by a few years the oldest day school in the country. The authorities in charge of the Congress have allotted to it two of the best rooms on the main floor of Devonshire House, which provide it with a hanging space as large as that devoted to any other school. This compliment encourages me, therefore, to explain in a few words the aim of the School and the choice of drawings for its exhibition.

The Liverpool School differs as far as I know from any other British school of architecture in two main respects. The first is that, while like others of the larger schools it has lengthened out its courses to five years, it has at the same time differentiated its fourth and fifth year students into three separate classes. These classes are those who aim at a degree or diploma with honours in design, those who aim at the same thing with honours in construction, and those who aim at a pass degree or diploma in which those subjects are more evenly balanced. Either of these three is accepted by the R.I.B.A. as equivalent to its final examination for Associateship, with the exception of a paper on professional practice, but in the first two at least Liverpool believes it has set a considerably higher standard in the directions indicated. By differentiating among its students in this way it is felt that all students are not driven through the same mill; that, for instance, those who by inclination and ability are better able to solve constructional problems have a chance of further exercising their skill. As has been pointed out by external examiners and others, it has been found at Liverpool that such students, far from lagging behind the others in design, when it comes to their final thesis design, which they have to prepare by themselves, often reach as high or even to a higher level than those who aim at distinction in design. I think this comes about from the fact that while they have the same design criticism from the same tutors, their work in construction makes them view their detail with a closer eye to economy of effect. Their final thesis design having to be carried to the stage of working drawings becomes a very practical and real thing.

In the room devoted to fourth and fifth year Liverpool work two of these thesis designs, one of either type, are shown. That by Mr. Gabr, of the constructional type, consists of a set of sixteen working drawings for a large theatre suited to Cairo; that by Mr. Fry, of the honours in design type, consists of a recreational centre at the sea-side—a subject set for the final round of the Rome Scholarship. These are the two main exhibits in this room. The former is shown with all its drawings to make clear the scope of the final test required from a Liverpool student. It might have been more interesting to have shown less drawings by one man, but we felt by showing these two theses we best explained the aims of the school curriculum.

The other way in which the Liverpool School differs from other schools, or used to differ, is that at Liverpool the students are not encouraged to seek exotic modes of expression in design. In the main they are kept to what may be called the central position; that is to say, they work out their problems making use of Classical and Renaissance forms. It is felt that this gives the best grounding for the average student. In his life when he leaves the school he may and probably will develop more personal forms of expression. He will not, we hope, with such a grounding, however mediocre his ability, produce vulgar or over-individualistic work. Looking at American buildings we feel that this is where the chief value of the great American schools has laid. Genius will always break through the academic hedge, and will be no worse for the process. The ordinary man, however, in his youth requires the protection of the hedge so that he can study fully all that lies within the garden. Later, too, when he walks abroad he will have some idea of his bearings.

The hedge, though, is not such a very high one at Liverpool that the student cannot occasionally peep over it. The series of six-hour sketches that is shown, both in the fourth and fifth year room, and in that devoted to the three earlier years, is evidence of this. From these it will be seen that as soon as the student has anything to express he is encouraged to express it. Every Monday, from 10 o'clock to 5, with an interval of an hour, he is set a subject the main object of which is to fire his imagination. It is found that these Mondays at sketch designs not only help to give the student greater facility in his draughtsmanship, but break the monotony of the long continued study required by the larger schemes or by making a set of working drawings.

With regard to these latter the Liverpool School has of late years made a great point of each student turning out before he finishes his third year, and again before he finishes his fifth, two complete sets of working drawings, the former of a small subject, the latter a large. It may be argued that this is often work which the student should learn away from the school. That I know is the American practice. In the absence of quantity surveyors the American standard of working drawings is very high. With us it is not always so. We cannot be sure that the student will learn this very necessary part of his work outside the school. We therefore include it in the curriculum, and as stated above we find it has a distinct educational value. The work at once becomes practical, and the design thereby improves. The aim of the Liverpool School, as its prospectus says, is "to provide a full professional education at a University standard." All who obtain the Liverpool degree (B.Arch.) must reach this standard. It is one I hope of knowledge, efficiency, and good taste. Beyond that the young architect, as any other artist, must develop unfettered and by his own genius.

London University Department of Architecture, University College.

By PROFESSOR A. E. RICHARDSON.

IN 1926, University College will celebrate its centenary. The School of Architecture, however, is comparatively youthful, for from the time of its inception under the direction of

Professor Donaldson to the present, it totals in years little more than three score and ten. On such a count as the foregoing it ranks as the oldest school of its type in the country, with the exception of the Royal Academy School. The Department is an integral part of the organisation of the University of London and is closely allied to the other sections of University College. It is because of such close associations with departments that specialise in subjects indispensable to the training of architects that the school can claim unique advantages. On the one hand it is in close collaboration with the Slade School, and on the other it enjoys facilities for study and research offered by the famous School of Engineering. In addition there are the Departments of Egyptology and Archæology and many other sections of research which in some measure are bound up with architectural training.

It has come to be recognised that although architecture is a fine art in its supreme aspects, having both intellectual as well as emotional qualities, it is also largely a scientific art, demanding close application as well as a study of many auxiliary subjects. Of all the branches of knowledge and attainment, therefore, it can be claimed that building, using the term in its highest sense, reflects social conditions both exactly and in a great measure permanently. Writing of the system under which the students work, it can be said that the regulations have been framed to include factors ranging from scholarship to those concerned with realities of the present day. This, to be precise, is the determining policy of the school. The freshman, on entering, is required to furnish evidence of a high status of preliminary training and general culture. From the outset he is led to appreciate the fact that he is a member of a college possessing traditions, and, further, he is encouraged to acquire a view of life which proves in after years to be of the utmost value to him in his dealings with his fellows.

The courses are arranged in three distinct groups, which run concurrently and to some extent on parallel lines. These courses can be summarised as follows:—

(*a*) The Certificate course, which extends over three years, on the termination of which the student, subject to passing the requisite examinations, is entitled to exemption from the Intermediate Examination of the Royal Institute of British Architects.

(*b*) The Diploma course, which continues for four years, namely, four years in the school and six months in the office of an approved architect or in the works department of a contractor, supplemented by evening work in the atelier.

(*c*) The Degree course of five years, which in some respects corresponds to the Diploma course, but for which matriculation is essential.

The two latter courses, with the exception of one examination, enable students to qualify for Associateship of the R.I.B.A. The Degree course, however, has the additional value to the successful candidate of a B.A. degree. There are also special courses for students who are already proficient in some branches of the subject of building, but who may desire intensive training during a shorter period than the courses usually arranged for beginners. It is one of the features of modern methods of training, and one that has received the approval of the Royal Institute, that every school shall proceed on its own peculiar and particular lines. It is a factor of extreme importance, for it admits of individuality in the training and precludes stereotyped development in the work, which, if all schools proceeded on similar lines, would be productive of a certain monotony of result. In this sphere of individuality the Department of Architecture at University College is fully represented, the aim of the instruction being to encourage good taste and to develop the latent powers of students of different temperament. At the same time, the scientific aspect of the vast subject is held closely in view. An intending student who desires to follow the profession of an architect in the first place must show that he has taste as well as ability to draw; it is also essential that he be gifted with the power to concentrate on continuous study. When admitted to the College such a one, in the preliminary stages of his training, attends lectures and demonstrations on the elementary principles of building, such as simple construction and the properties and nature of materials. He is exercised in drawing, both mechanical and free, and joins a group under the care of an instructor who superintends his work in the studios and in the national museums. This feature of instruction is continued during some part of each of the succeeding years, so that the education of the student in drawing and presentation is continuous on an ascending scale and proceeds side by side with affairs of a more technical nature. From the beginning the historical aspect of building is given prominence. There are lectures on pre-Classic and Classic, followed by others dealing with mediæval, Renaissance and modern developments. The training is of the broadest. It is schemed to include a knowledge of the art of all countries, but at the same time the student is led to think of building as a scientific art responding to definite conditions. The system of training has resulted from years of tradition and experience of other systems abroad. The view-point of the Department is the catholic one which has the merit of placing building above style and fashion; but the student at a very early stage perceives the differences between mere building and building which is articulate and representative. It has been recognised that better results can be obtained from students by allowing them freedom to reason rather than counselling them to accept ideas without regard to the appropriateness of the idea chosen for the work in hand.

It is not long before the student appreciates the three-dimensional viewpoint and thinks of his work as a structural entity rather than a decorative pattern. The building up, stage by stage, of a species of intellectual scaffolding eventually fits the student to undertake subjects of a more ambitious nature. He proceeds in time from comparatively simple subjects to those of a more complex character, demanding closer application and study.

The main issue is that the courses are of a progressive nature, having for their ultimate objective the fitting of a student for the realities of practice.

Since the amalgamation of the Department of Architecture with the school formerly at King's College, and essentially during the past five years, the curriculum has been reorganised in every branch. There is now an evening department including an *atelier* and special classes for construction. The *atelier* is primarily for the benefit of Degree and Diploma students taking the fifth-year course, which is partly worked in an approved office. The *atelier* is also open to external students who can furnish evidence of artistic and technical ability. In all branches of the Department it has been found expedient to concentrate on subjects coming within the range of daily experience, and this without sacrificing or disregarding the value of idyllistic essays.

To assist in this departure, there is being formed in the *Archives* of the Department a collection of modern working drawings and designs, as well as scientific data, which corresponds in bulk to the research work of other departments. By such means it is hoped to establish a collection of drawings showing modern work which, in so far as data is concerned, will be authentic and invaluable.

Although students are encouraged to study historical examples of building, undue stress is not given to any particular phase of design; rather attention is directed to logical planning and an appreciation of scale, as well as an understanding of the quality of past masterpieces. It is now being realised that style cannot be forced on a student, but it is also being understood that even buildings projected on paper will have inherent style if planned logically to assure definite conditions. The difficulty before teachers is to establish the resistance necessary to design, which is ever present in practice, but not in the case of school work.

At the end of the course of five years, both Degree and Diploma students have spent one year in an office. They have attained to a appreciation of the conditions governing modern architecture, and at this stage they are capable of assisting a practical architect

Department of Architecture, Cardiff Technical College.

By W. S. Purchon.

This is one of the newest of the schools and is only of moderate size, having been started rather more than four years ago, and having during the past session 46 students in all, 18 being full-time day students, 19 part-time day students, and 9 architects' assistants attending an evening design class.

Better immediate results for exhibition purposes might conceivably have been obtained had we fitted our scheme to the prevailing pupil-system and limited our activities for some years to the part-time students; or on the other hand, we had devoted our energies entirely to a full-time three-year course. It was felt, however, that notwithstanding the numerous difficulties involved, it would be in the best interests of architectural education in Wales if we attempted the task of building up, year by year, a complete five-year course, consisting of a three-year full-time day course, followed by two courses of six months, each spent in the College, the intervening six months being spent in architects' offices. At the same time we considered it our duty to provide already as adequately as possible for pupils in architects' offices by including a part-time day course, and for architects' assistants by arranging an evening *atelier*. It should also be mentioned that in the first two years of the existence of the school there were a number of ex-Service students all of whom, it is pleasant to record, have since obtained suitable appointments (as have also those full-time students who left at the end of their third year). Two of the ex-Service men held the R.I.B.A. Henry Jarvis Service Travelling Studentship, and benefited much by the opportunities it gave for study in Italy, France and England. It should further be stated that in arranging the courses the object in view was not the obtaining of rapid results, but rather the laying down of a systematic scheme on broad educational lines the results of which may not be obvious in the early work of the students but which can hardly fail to be of value to him in later years.

So far, of course, only four years of the scheme have been at work; next year the fifth year course will be started, and then for the first time in Wales there will be a full five-year scheme of architectural education available. Four students have qualified to enter this fifth-year, and five to enter the fourth year next session.

The more obvious results so far achieved by the adoption of the methods indicated above are that a number of the ex-Service students obtained their Associateship of the Institute, several of the part-time students passed the R.I.B.A. Intermediate examination, eleven full-time students have obtained the College Certificate, and that this certificate awarded at the end of the three-years full-time course has been accepted by the R.I.B.A. in lieu of the Intermediate. Among the less obvious results may be mentioned the fact that the scheme for the award of degrees to students of architecture has been agreed to by the University College of South Wales and Monmouthshire, and the means of bringing this scheme into action are being considered by the bodies concerned.

In view of the difficult times through which the country has been passing, the school was distinctly fortunate in being able to obtain, after about one year of its existence, a full-time lecturer; Mr. R. H. Winder, M.

.I.B.A., was appointed to this post, and tever the degree of success so far achieved he school may be it is largely due to his ity and energy. At the end of the third Mr. Eric Page, A.R.I.B.A., was ap- ted as a part-time assistant, and as he since accepted another appointment his e is to be taken next session by Mr. Lewis n, B.Arch., A.R.I.B.A. In addition to its staff, the School of Architecture has the at advantage of assistance from other De- tments in the College, the students attend- courses in the School of Art, the Engineer- Department, the Department of Industrial emistry, and the Department of Mathe- ics.

he South Wales Institute of Architects is close touch with the school, which it vely supports. It has handed over its ry to the school, its President (Mr. Percy mas, F.R.I.B.A.) acts as design critic, with a number of other leading architects, ding Mr. T. Alwyn Lloyd, F.R.I.B.A., Mr. H. Teather, F.R.I.B.A., assists in in of the lecture courses. In appointing first external examiner, the school was cularly fortunate in obtaining the services Ir. Paul Waterhouse, whose wise counsel friendly criticism have been invaluable in building up of the school.

versity of Manchester School of Architecture.

By Professor A. C. Dickie.

IE total number of students in this school ages about thirty, and examples of the of nineteen students are hung at the bition; the exhibit is therefore repre- tative of the general standard. The sets rawings illustrating the various designs incomplete, as the restricted wall space ssitated a somewhat arbitrary selection. e earlier design studies consist of assem- parts into a simple structural whole in particular style chosen, a reasonably free being allowed within the phases through h the style has passed. Later, simple lems in modern subjects are tackled, and develop as the course proceeds. Time- ch subjects are frequently set.

re is taken, particularly during the first years, to bring the student up to a good dard of draughtsmanship and rendering, at the risk of becoming mechanical. Up he third year time-sketches are not too iently set, in order that the bad habit ose draughtsmanship shall not be acquired. care taken serves a double purpose, as, e establishing a habit of careful draughts- ship, it also fosters scale exactitude. -inch and full-sizes form an important of the work from the first year onwards. o method adopted aims to produce one hed subject a term, but this is not always enforced where it is found to be unsuited to the individual, in which case the routine is modified. Such elasticity produces quite satisfactory results in small classes, sometimes ending in an absolute turnover of relative class standards in the final years. In addition to these more complete studies, the time-sketches constitute more particularly exercises in modern planning, co-ordinating as they do with lectures on theory of design. These exercises are invaluable in developing facility in grasping the essentials for a programme and in readily committing ideas to paper.

A short course in town planning at the end of the second year gives an idea at this early stage of the value of fitness and environment. The third-year subjects of design are chosen from buildings occurring in the lay-out of the previous year.

Lectures and exercises in building construction are co-ordinated with the subjects set in design and, in the earlier stages, with lectures on history of architecture. During the fourth and fifth years tutorials are given in the particular problems arising out of the set subjects in the design studio.

Instruction in measuring is given at the end of the first year, and all measuring and plotting are done during the vacation.

The official working hours of the school are thirty hours per week for the session of thirty-two weeks. The school is, however, open practically at all hours, a privilege of which full advantage is taken. The library is always open, and a free use of books and plates in the studio is allowed.

In general the aim of the system in operation is to encourage appreciation of form as distinct from style taught on the basis of tradition as exemplified in styles.

Royal West of England Academy School of Architecture, Bristol.

By G. D. Gordon Hake.

We are a young school, probably the baby of the Exhibition, but we represent an interesting educational experiment on the "sandwich" system. We combine the system of pupilage with the modern methods of architectural education.

At present the student, on signing his articles, enters the school in the preliminary course. He devotes about a quarter of his time to the school and three-quarters to the office. In some cases the student spends a greater percentage of his time at the school. Thus, with the exception of a few whole-time students, the practical work in an architect's office enables the student to concentrate more particularly on the theoretical and more academic side of his training. The school is affiliated to the Architectural Association in London and models its curriculum and terms more or less on the lines of the A.A. schools.

Founded early in 1921 by the Bristol Society of Architects, the school was officially opened by H.R.H the Prince of Wales in June of that year. Until 1923 the work was directed from the Architectural Association by Mr. H. Chalton Bradshaw, and later by Mr. Gordon Holt. This pioneer work did much to develop the imagination and enthusiasm of the students. At the beginning of the session 1923-4 it was decided that the progress and future development demanded the appointment of a resident master. At the beginning of the session 1924-5 the staff was augmented by the appointment of Mr. E. H. Button, who, as senior student of the school, gained the Dame Janet Stancombe Wills Travelling Studentship and won the Ashpital Prize with distinction in thesis last year.

The staff of the school is as follows:—Advisory Director of Education: Mr. Robert Atkinson, F.R.I.B.A. (Director of Education at the Architectural Association, London); Head Master: Mr. G. D. Gordon Hake, A.R.I.B.A.; Assistant Master: Mr. Eustace H. Button, A.R.I.B.A.

The curriculum is as follows:—There are two Courses, (*a*) Preliminary, (*b*) Advanced. Each course is sub-divided into two grades.

The subjects of the curriculum include:—*Preliminary.*—Drawing: Freehand, geometrical, isometric, perspective, projection of shadows, elementary stereotomy, lettering. Colour: Properties, theory and application, rendering in wash. Modelling. Mathematics: Geometry, theoretical construction, projections, conic sections. Construction: Elementary applied, walls, foundations, doors, windows, floors, roofs, materials, properties and uses. Design: Pattern design, elements and theory. History: Lectures, analytical studies, classical detail. Expression: Oral and written observation.

Advanced.—Design: Application of elements and theory, planning, sketch designs with and without reference, two-hour problems, studio work and lectures, embracing domestic, interior decoration, monumental and civic problems. Construction, Advanced: Working drawings based on designs, problems with and without reference, materials, nature and application, specification, professional practice, hygiene, etc. History: Lectures, analytical study of plans and decoration, sketching and measured work. Mathematics: Advanced theoretical construction, stereotomy. Draughtsmanship—Architectural presentation and Graphics: Both (*a*) as a means, *i.e.*, a language for expressing the design, and (*b*) as an end, *i.e.*, working drawings; application of projections and conic sections, realisation of designs in perspective, sciography, modelling and drawing from the life. Colour: Decorative schemes, advanced theory and application. Expression: Oral and written, observation.

ARCHITECTURAL EDUCATION IN THE PAST

he first day for discussion at the Inter- onal Conference on Architectural Education, nised by the Royal Institute of British itects, was held at 9, Conduit-street, on day, when the subject for discussion was chitectural Education in the Past."

ie chair was occupied by the Earl of Craw- and Balcarres, who in his opening statement it was due to the scholarly intuition of ssor Beresford Pite that they were able ar the papers about to be read.

FRANCE.

Architectural Education in the Past in ce" was the title of a paper by Mr. Paul (Directeur des Beaux Arts), who said for centuries the teaching of architecture ance had left no other evidence but the ments themselves. They merely knew names of the great schools established two thousand years ago in the cities of oman Gaul; they knew that Romanesque ecture thrived under the shelter of cloisters and was taught there in the same way as all the liberal arts. It seemed to be firmly established now that masters of Gothic works, though laymen, received their education in monasteries. In their turn they had a large number of pupils. The building yards of cathedrals were living schools. The "house of work," the "lodge," the "marking room," were the agency, the studio, the office of the architect. There was besides, nothing in common between the modern builder and the mediæval master, who was of the same origin as the workmen he employed. Like the workmen, he passed through a period of apprenticeship, and served some time as journeyman. The art remained combined with the craft, the management with the undertaking. The teaching was not imparted from a chair. Processes were transmitted, recipes communicated—non-official advice, rather than official subjects; experience was gained in the building yard. There was besides no intention to divulge the results: the plans, sections, elevations and models were intended for the executants and for them only. They were not documents comparable with our drawings. The album of Villard de Honnecourt did not contain either measurements or dimensions; general indications were sufficient for the craftsmen trained to recognise, by habit and by instinct, the suitable dimensions for each part of the building. The method of learning by apprenticeship, maintained through so many centuries, had left deep traces on modern teaching, in spite of its abolition. The architect, in the sense in which we understood that word, dated really from the Renaissance. To the new name corresponded new functions. He no longer belonged to a corporation; he was an artist brought up more on theoretical studies than trained in the practice of a craft. Whilst the master builder had difficulty in writing his signature, the architect received the benefit of the bourgeois education. He read treatises; he could in his turn write them. He gave orders to corporations without having belonged

to them; he no longer took direct part in the undertaking.

ITALY.

A paper prepared by Messrs. G. Giovannoni and P. D'Achiardi stated that the marvellous continuity of Italian architectural tradition which had endured now for over twenty-seven centuries found its direct explanation in the continuity of thought and feelings of the race; that was to say, in a widely diffused architectural education for which the surviving monuments formed concrete elements of record and derivation. But as regarded the specific preparation of architects and kindred workers, though there were some examples of institutions having their roots in the past, such as the Art Corporations of the Middle Ages which possibly represented a continuation of the old "Collegia," it could not be really asserted that there was a regular and direct connection such as between the links of a chain.

Up to a comparatively recent time there was never a real true unity in the professional figure of an architect and in the methods of teaching him, so that the very title of architect was frequently confused with other titles, and his activity with other artistic or constructive activities.

AMERICA.

Professor Wm. A. Boring (Columbia University) said history of architecture in America did not reach back to a past crowded with historical associations of the great periods of art which flourished in Europe. When other countries were building luxurious monuments of art, the beginners of the American Republic were building log cabins for protection against the elements, and surrounding them with stockades of tree trunks to save them from the arrows of the redskins. Their first buildings with any claim to beauty were modestly copied from good English and Dutch examples modified to suit the climate, and confined to that simplicity which limited resources demanded; a style was thus worked out which reflected the Renaissance with a pronounced meagreness in detail, but with great refinement and a delicate sense of proportion withal.

America, like England, had no established Government school for teaching architecture. Unlike France, where they had had a successful system of national art schools for two hundred years, they left higher education almost entirely to private institutions. In America there seemed to be, on the part of legislators, great distrust of architects in private practice. Employment of distinguished architects was looked upon as a great extravagance, and the debate was usually not on the ability and integrity of the architect, but on the sum of money he was to be paid. If the Government were to foster the education of architects, that attitude would probably change for the good of public buildings and the advancement of art.

In the early days of instruction engineering seemed more important than design, and that had had a strong influence on architecture. There was a time when mathematics were employed to test systems and members of construction was the main idea stressed in teaching how to build. Now they tried to teach students to feel construction by considering the building as something alive, existing in equilibrium, because every bone in its body was quietly doing its work. The graphic method of analysis of forces seemed to impart this sense of construction to students.

Their buildings were framed in steel, a really terrible material in its possibilities for ugliness, and yet it was the basic idea they could not escape. Masonry was only the flesh-like covering of the structure of steel, which could go to any height and span any void. Vaulted forms were no longer functional. Tall structures were putting them to the test on that problem. And should they develop a satisfactory style under present conditions, what were they going to do when rustless steel and other unchanging metals were used, with smooth-welded joints in the buildings? Could beauty of form follow in true expression the leaps and bounds of science?

ENGLAND.

"A Note on Architectural Training in the Past, with Special Reference to England," was the title of a paper by Mr. Paul Waterhouse, who said there were many reasons why—whatever be the methods of refining education in craft—the ancient system of learning by being a practising junior under a practising senior should never be left out of account. Systematised academic training in architecture was a product of the last hundred years at most. Its history was very interesting. It had been rapid in growth and successful in results. With all his enthusiasm for academic schooling, he was aware that there was no school but experience that made a man safe in architecture—and by safe he implied, not merely able to build what would defy gravitation and weather, but sure of being able to produce what he was able to draw. Experience could only be gained by working as an architect on actual buildings. For those buildings someone must be responsible. Happy and few were the beginners who could shoulder responsibility alone without first practising on a responsibility shared.

After referring to the great architects from the time of Wren, he said what pupilage was in the days of Queen Victoria most of them knew by tradition, repute, or experience. That it differed enormously between office and office there could be no doubt. That, in some cases, it was a farce was, he was afraid, true; that in many it was a very glorious discipleship was equally and honourably true. In all cases the amount of learning to be gained from it must have varied, not only with the character of the master, but also with the opportunities which the master's clients provided. If a leisured office gave the master the best opportunity of individual teaching, a busy office probably afforded, by the brisk friction of stirring practice, the most animated encouragement. Be that as it might, they had amongst them at this time survivors of the Victorian training, whose work and character testified to the force of those training grounds not less clearly than did their spoken reminiscences of the great men of their fathers' time.

What the Institute did at the close of the last century in setting up first the tentative voluntary examination, next the obligatory, and, finally, the three-fold system, was nothing more or less than to force and to foster the hands of the new race of educators. The parallel growth of the Architectural Association as a teaching body and the gradually increasing efficiency of the classes under professional guidance at University College, King's College, and South Kensington, worked together for good in the same direction and became with one other force the irresistible origins of our present system.

That one other force—one easily forgotten but not lightly to be ignored—was the cheerful willingness of the senior architects of those days to hand over to schools and classes the young men who, to speak quite plainly, had been a fruitful source of revenue in premiums and sometimes of most valuable office help occasionally unpaid or underpaid.

Let them learn and remember one or two things which were of real importance to the study of that really great subject. The present system of academic instruction was not really a break with the past. It seldom happened that a school student found himself at the end of his course in sole command of an immediate practice. As often as not his career as a graduate in architecture began or continued in a draughtsmanship. As an assistant, he would experience that happy comradeship with an elder which the abolition of pupilage might have seemed to extinguish. Friendly rivalry among fellow students had been and always would be one of the greatest incentives to progress. That was the reason why a large office full of pupils was in the Victorian days a better training ground than a small one. The schools provided that rivalry to perfection, and thus gave by their very nature what under office pupilage could only come by chance.

In the days of the eighteenth and for h the nineteenth century, foreign travel w almost invariable prelude to successful cu practice. What was the object of that tr Sometimes, as in the case of Robert Adam to the Adriatic, it was actual discovery digging out for oneself of architectural which no book-learning in England could s Sometimes it was the mere seeing for self of the grandeur which no record, no dra no picture, could transfer. Always it wa contact with masterpieces which meant delight and possession. To-day, the ledge of every accepted work of art was sible by means of books, photographic trations, and measured drawings. The sc an architect's study of the past was wider than ever and more rapidly ach Their debt to the men who had reduc black-and-white documents the inform which of old had to be sought by trav immense. But the letter killeth; and a happy reflection that no learners of tecture and no teachers could avoid the dis that actual personal vision of building indispensable to the appreciation of what tecture was and meant. Quite apart fro fact—a most important and pregnant that drawing from a building, it conscien done, was the finest and deepest form of there remained the wonderful realisatio the presence of perfect architecture had the architect a direct, a magic, an in influence which no learning could expla no logic could deny.

DISCUSSION.

The discussion following the paper was by M. VICTORA HORTA (Academie Ro Belgique).

Professor BERESFORD PITE, who fo said architectural education had not nec gone with the Renaissance; they we actually in the Renaissance to-day. methods and subjects, and habits of were those of their Renaissance ar They were, however, beginning to ap to a greater degree the marvels of Egyp In the East there were fields of arch and art hardly yet explored or understo a Congress let them seek to widen their and not confine it to the academic trad Renaissance architecture, or to the sy modern architectural practice. The a of the ancient world were not the pr any school, but of an era, their work th sentation of national life. Their embodied sentiments, chiefly religious were not included in the education architect of to-day. Behind Greek arch was a fundamental religious principle

Lord CRAWFORD, in closing the d said there was one feature every spe endorsed, and that was that in the relation between the architect and was intimate and continuous, that familiar with the process of constru the materials he employed, and the be of handling them. Architecture wo do justice to itself if the architect were from the actual handling of the on which the result of his depended.

ARCHITECTURAL EDUCATION IN THE PRESENT

cond day of the Congress Sir nfield presided. In his opening said they were going to deal that architectural education of the the absence of M. Gustave e called upon Professor Anoni to paper, "Architectural Education Present Time."

ITALY.

VE GIOVANNANI'S paper stated r to arrive at a proper under- he present conditions of teaching e in Italy it was necessary to turn me about fifty years ago, when, definitely become a nation, the higher studies and institutions for so that the interference of local art in such institutions, which moment was paramount, com- l. In the new State regulations, ras, so to say, split into two parts follow two divergent paths. On it was attached to schools of civil which assumed great importance h rank in the field of pure and e, so that for a long time the title ion of architect were absorbed in ed by civil engineers with an hnical training but occasionally ent artistic preparation. On the nstitutes of fine arts, founded in number of various Italian cities, e teaching of architecture with ing and sculpture, thus bringing architectural artists of form more ance, whose excellent training in perspective conception was not upported by technical training building or even by an adequate f general culture.

m had not given entirely satis- . It was true that from the two ols came fine architects, but the emselves insufficiently prepared to problems, possibly more arduous n elsewhere on account of the strong inheritance of monuments nd of the continuity—unique in f their architectural tradition; were those of agglomerations of to the enormous development of ne respect for the environment of , to the necessity of complying litions, and to the new methods of

s, the system followed had not fluce considerable advantages by if not the intensity, of archi- e. In Italy every civil engineer, nary engineer, had a by no means itectural education as he had a ducation; the relations between nd the other arts had, on the other been completely severed; and study, survey, and excavations greatly benefited by this know-

pts to give a full and complete itectural studies and to the title had been very numerous during ars. Special sections for archi- nts were founded at the poly- . They culminated finally in the ion of the High School of Archi- ne, and this school had become n for architectural teaching and he title of architect.

chool of Architecture in Rome y, for admission to which it was e general knowledge similar to schools, together with an artistic to that of the ordinary courses s of fine arts; such training either by official certificates of admission examinations. The years, and the studies were of ic and professional character; that was to say, arranged so as to cultivate progressively the mind and the feeling for art.

In other words, this system aimed at forming a complete architect for whom art should not be an abstraction but should be expressed in concrete positive subjects, and science should not become an arid practice of expedients and forms. And in that way had been overcome the prejudice of incompatibility between the two orders of study, by the re-assertion that the aptitude for the exercise of the profession of architect could only be found in those who could understand and harmonise both.

The curriculum included various "cycles" of subjects: scientific subjects having to do with the science of building (strength of materials and calculation of building plans), which were treated in a thoroughly scientific manner similar to that followed in schools for engineering, though limited to special ends; artistic subjects, first in the field of general preparation, then in that of decoration and of various architectural and ornamental applications; practical and professional subjects; subjects of historical character; finally, architectural subjects proper, among which stood out architectural composition to which all the others converged like several tributaries to a single river. Bearing in mind the principle that it was important to interest the pupils by letting them deal with concrete subjects, instead of making them go through long abstract exercises or copy drawings, composition, in which the student began to exercise his brains and to form his artistic taste, was introduced in the first year. But the first composition dealt with the most elementary subjects as regarded the construction itself and the artistic importance; the composition of the second year chiefly dealt with subjects of stylistic character (proposed within well-defined building and artistic environment) as commentary on the course of history of architecture; in the third and fourth years the subjects became larger both as regarded the constructive part and the special purpose for which they were intended (character of buildings). Finally, the fifth year, besides treating some subsidiary matters, was devoted to the compilation of schemes or plans complete in every detail, with proper artistic, technical, practical, and economic elements.

Commendatore GIACOMO BO SI (Director of the Excavations of the Roman Forum), who also read a paper on Italian architecture, said Roman architecture had followed the track of the victorious legions, but that imperishable monument of glory of the Italian race, having faithfully kept to the traditions of sincerity and honesty, came to life again in the sixteenth century and imparted new splendour and beauty to the most barbarous places in the lands conquered by Rome. The art was unfortunately getting lost at present, as it had been used to produce architectural fakes of *papier màché* or reinforced concrete in the service of the cinematograph industry, which was thoroughly mendacious, and constituted a libel on the Roman name. It was, therefore, necessary to return to a serious and analytical study of the noblest authentic monuments of Roman architecture which had been produced by the great Italian artists of the fifteenth century and the whole of the Renaissance.

AMERICA.

Present-day education in America was dealt with by PROFESSOR D. W. EMERSON (Massachusetts Institute of Technology), who said the present inherited from sixty years of architectural education a vigorous infant standing firmly on his feet; reaching out from time to time, perhaps, to a classic bench, a Georgian mantel or a Louis XVI armchair, for assistance in his early wanderings, but showing withal a natural curiosity as to his surroundings and a certain sturdy independence of spirit.

For the guidance of this promising youngster, two organised systems of education already existed, and they would, he trusted, in addition, always have the services of those devoted individuals whose offices and example might well serve as apprentice schools of the greatest value. Organised teaching was effectively handled by the schools of architecture and by the Beaux Arts Institute of Design. These two institutions varied widely one from the other in their methods and characteristics. At the same time they actively co-operated to the end that satisfactory performance in the one was accepted as a basis for classification or advancement in the other, so that, though approaching their problem from different angles, they united in serving a common cause.

Teaching had to be adjusted to the needs of different groups of students. The first, and probably the largest, included the graduates of high schools; the second was composed of students with a degree indicating that they had completed four years of study in a college or university following their preparatory high school course; in the third group were included special students, namely, draughtsmen of three or more years' practical experience, presumably over 21 years of age, but without sufficient scholastic or collegiate preparation to enable them to pass the required entrance examination.

If there was any one distinguishing characteristic of modern life it was perhaps its complexity—a characteristic possibly even more emphasised in America than elsewhere, and therefore calling for particular recognition in the preparation offered to the American student about to take that crucial step from theory to practice. At the present time they might, therefore, be said to be cleaning house. They were working for one great objective—the more general recognition of architecture as a profession for the practice of which adequate preparation was essential; and to that end for the better use of the time at present at their disposal, together with either a longer undergraduate period or the requirement of a degree as a pre-requisite for entrance to the schools of architecture. With this as their goal what was the nature of their house cleaning? They were eliminating the unessential, getting rid of those undesirable inheritances that for the most part were the result of the engineering environment in which they had grown up. Such mathematics as was valueless outside of the class room was being replaced by history or design. First-year courses in mechanical drawing were now given over to freehand drawing or theory of architecture.

In brief, the major effort was being directed toward:

(1) The teaching of fundamental principles rather than the study of countless details.

(2) The teaching of the orders and elements of architecture in their normal relation to structures rather than as isolated features.

(3) The producing of programmes that were illustrative of modern problems in their own country based upon intrinsically sound principles of composition in plan and decoration.

(4) The adaptation to local conditions of the *atelier* system and with it of that logical procedure in the study of design, for both of which they were indebted to the Ecole des Beaux Arts in Paris; and finally,

(5) The co-ordination of teaching, whether it be of history, construction, drawing or modelling, so that each and all united in emphasising the transcendent value of design as the keystone in the arch of architectural education.

The effort indicated under those five headings was obviously directed toward the achievement of that major objective. The more general recognition of architecture as a profession, for the practice of which adequate preparation was essential, and all five were correspondingly applicable to those three groups of students whose education constituted the problem.

The need of the high school graduate for a broader background, a wider acquaintance with the humanities, including those cultural studies

so essential to an understanding of modern conditions, was already recognised in some schools by the addition of one year to the four years hitherto considered the standard course. The resulting five-year course met the need as well as ensuring that greater maturity of mind and judgment in the graduating student that was so essential to an adequate grasp of his subjects. It condensed into five years spent in one institution what was generally obtained in six, by a combination of academic and professional requirements, in two institutions.

In considering the second group, composed of holders of the degree of Bachelor of Arts, they might admit that the high school graduate, on account of his greater youth, came to his professional studies at a more adaptable and impressionable age than the college graduate; still the latter had in all probability used his added years to acquire a most useful acquaintance with the humanities and had thus secured a broader foundation for his professional work as well as a more mature appreciation of the significance of the name "architect." Hence, for the members of that second group a period of three years was generally sufficient to bring them to a state of advancement, from a professional standpoint, equivalent to that acquired by the members of the first group in five years.

To the third group, composed largely of draughtsmen whose studies ceased with high school, all the schools offered varying facilities for completing their professional training on the basis of the office experience previously acquired. Unless those students made unusual sacrifices and met the standards required of regular students they were never candidates for the degree, but because of their long office experience and earnestness of purpose they formed a valuable element in every student group. It was in particular to meet the needs of the third group that the Beaux Arts Institute of Design was organised, and now, so truly had the Beaux Arts idea of *atelier* work won its way in America, that, without exaggeration, the architectural schools of the country might be classed as *ateliers* of this greater and more comprehensive effort. Many of the schools based their entire teaching in design upon the programme and judgments of the American Beaux Arts Institute of Design. Others did so for certain grades or certain selected groups of their students, and others, again, because of local conditions, only availed themselves occasionally of the opportunity offered; but all profited either directly or indirectly through the better standards resulting from this nation-wide movement. Thus they found the schools, while both helping in and profiting from the activities of the Beaux Arts Institute of Design, interested keenly in its further development and recognising the advantages and opportunities that resulted from association with it. In consequence they saw the work of the draughtsman in his *atelier* placed beside the work of the student in the school. Both were judged by a jury composed of teachers and practising architects, all of whom had a common interest in maintaining the high standards of the judgments, and all of whom alike made that voluntary sacrifice of their time in order that the youth of to-day might benefit from the lessons of the past and might in turn be the torch-bearer of the future.

It might be well to comment on one other feature that characterised the American educational system. He referred to the effort to have as teachers of design as well as the heads of schools of architecture men who had been, or still were, practising architects; men who were in daily contact with the difficulties of the job were much more likely to be patient and understanding critics than those whose chief aim was academic or mere paper perfection.

They might well ask: "How do your students become acquainted with the great architecture of the past?" In so asking, they would touch upon, perhaps, the greatest handicap under which they laboured. The need for acquaintance with the monuments of Europe through personal knowledge rather than through books and photographs was recognised with the creation of their first school of architecture. A new country such as America, with nothing that could by the most generous be called architecture dating back more than 250 years, needed contact with the past. To that end travelling scholarships had been created and now existed in fifteen or more schools. In addition half a dozen more were privately endowed. Those all ensured for the most promising students anywhere from six months to two years of travel and study in France, Italy, England, Greece or Spain as conditions might indicate.

No description of the modern educational system was complete that omitted mention of one feature that was outside the dry bones of their undertaking. That it was that gave to the problem the breath of life, that made architectural education a thing of the spirit as well as the body, that had won the selfless devotion of the teachers of the past—imagination. Imagination was essential if they were to meet the demands of their complex modern life, essential in both student and teacher. No precedent existed for the solution of many modern problems, they were as new as their country, as their civilisation, as even some of the materials with which they must deal. They could only be solved with the help of that type of imagination that could see beyond the written word or evident fact, that could find the great underlying principle without being misled by a myriad of half-truths. Imagination could not be taught, it could only result from that perfect relation between pupil and teacher where the one was as eager to learn as the other was to teach, where the effort to acquire was at least commensurate with the desire to give. Imagination need not mean genius, it meant rather a capacity to see the essentials of a problem without its trappings, to look at the rough sketch with the fresh eye of a discoverer, ready to see with an open mind rather than with the eye of prejudice. It made of an otherwise dull academic routine a joy, a delight—a thing inspired. When added to the normal essentials of an architectural education, it supplied the spark that made their dull efforts glow with enthusiasm. Imagination made of the present study of architecture a thing transformed and glorified, for which no sacrifice was too great.

FRANCE.

M. DEFRASSE, speaking on "Architectural Training in France (Present)," said the teaching of architecture in France was centralised in the *Ecole Nationale Supérieur des Beaux Arts* of Paris; regional schools of architecture existed in the chief towns such as Lille, Rouen, Rennes, Lyons, Marseilles, and Strasbourg, but they were themselves part of the school in Paris, the programmes being the same and the competitions being executed simultaneously in all the centres of training. The designs were sent to Paris, for judgment (under the condition of strict anonymity) at the same time as those executed in the capital: then, after the exhibition in the Salle Melpomène of the Ecole des Beaux Arts, the best of the designs which had obtained awards were exhibited in the various provincial schools.

The course for study in architecture was a long one and comprised four distinct cycles: the entrance examination (admission); the second class; the first class; and, finally, the big prize competitions. There were few cases of any student being able to complete all those stages in less than five years.

All the big *ateliers* and the special *ateliers* prepared students for the tests which formed the entrance examination, which comprised: a test of architectural composition in twelve hours, a drawing test and a test in modelling, each of eight hours' duration; then a written examination in mathematics, a test in descriptive geometry, an oral examination in science, and another in the history of art. The examination was a stiff one: two successive eliminations weeded out the candidates, of whom the number was reduced to 60, 15 being foreigners, from a total of about 450 candidates. Students of the provincial schools also took part in this competitive examination, and the last to be admitted must have gained a number of marks equal to the last candidate to be admitted to the school in Paris tests in science and mathematics corres to the "Baccalauréat de Mathémati l'Enseignement Secondaire."

The student admitted in the second after having negotiated the tests of t trance examination must, before pass the first class, successfully pass a furt of examinations in science, descriptiv metry, algebra, statics, stereotomy, p tive, and construction, and obtain at le "mentions" in tests of architectural c tion, for each of which two month allowed. The course in construction lasted for one year, was the object of divided attention of an eminent pr Monsieur Arnand, who had been able der the peculiar difficulties of his attractive by cinematograph and lanter comprising all the figures of demonst and numerous examples taken from buildings and modern construction.

In the first class, save for an exam in physics and chemistry, and anot building laws and regulations, both o were necessary before the diploma c obtained, students did nothing but c tions in architectural composition, ea ing two months, on programmes of a ture and decorative elements. Med "mentions" were awarded to the b signs: the unit being a "mention "mentions" were required by the stu take part in the test for the diploma concluded the course for architectural t

Students, however, remained on the of the Ecole des Beaux Arts, and mig pete in the *grands concours* until they the age limit, which was 30 before t and which would be progressively red 27 years. These *grands concours* wer which had money prizes attached to th sulting from legacies or foundations this purpose; in some the students the might select the subject, and inclu Grand Prix de Rome, which had been ence for over two hundred years; th petition gave the winner of the first p right to a stay of four years at Ro archæological journeys to ancient Gr Orient, and the colonies of the old Empire.

The course in science was given in ture theatres of the school itself, but work of forming the young archit carried out in the *ateliers*, where *projets de composition* were stud worked out. Students, in a twelve- ting *en loges*, and without assista their professor, prepared a sketc to a small scale of some subject w described in detail in a written pr The sketch fixed the general arrang idea of the composition, from w student was not allowed to depart; b two months in which to study the s all its details and subsequently to for exhibition and a judgment, whi mined the relative merit of work se was in the study at the *atelier* tha fessor took his part; he took his hand to correct faults, he discusse solutions of the problem, and from change of ideas in a common res student, while keeping his own p impregnated his mind with advice experience. hitecture in France was the direct re- n of the studies made by the architects Ecole des Beaux Arts. They should not tonished, therefore, to find in the build- f the early part of this century examples ed by the great periods of architecture, chers, on the contrary, corresponding to forms with the application of new ds and materials. These buildings were rthy of a careful and unbiassed examina- in order that their respective qualities be rightly appreciated. They must also e that in modern architecture one found dy of the improving hygienic conditions e: more air, light, pure water, trees and ght.

ENGLAND.

. CURTIS GREEN, on present education in and, said the present was a time of extra- ary interest and of development in archi- ral education; forces were at work which, as the younger men came into their own, would profoundly affect thought and achievement. He did not wish to be misunderstood; he did not predict super-architects. It was impossible to conceive higher ideals than those that had been borne aloft by their forbears, or than those held by the leaders they were proud to follow to-day. He did not anticipate greater achievement than theirs. What he foresaw was that for which the professors and masters in the schools were working, fostered and helped by the Board of Architectural Education—namely, the raising of the general standard and general understanding of architecture.

For sixty years there had been an examination for the Associateship of the Institute, and for forty-two years that examination had been compulsory. For twenty years the Board, established by men whose names were honoured in this country, had been in charge of the system. They were to-day in a transition stage; many students following the old road as articled pupils, getting such school training as might be available outside their office hours. There was no control over the quality or numbers that entered the profession in that way. There was at present no means of guiding their work other than by the examination system. One had heard of the faults and virtues of this system; they were in the main those common to any other that had as its immediate object the passing of examinations. It was, he thought, true that it was now unsafe for any young architect to neglect to obtain the "A.R.I.B.A."; his livelihood might depend upon his holding that recognised qualification.

The students and the examinations to which they submitted themselves were one of the concerns of the Board; the examinations themselves were the subject of constant supervision and improvement; the impossibility of dealing adequately with architecture by examination was fully recognised. Any stereotyped system tended to mediocrity and encouraged cramming, the use of books in wrong ways, and in the early impressionable years created a scale of wrong values in the mind of the student.

Such virtue as remained in the apprenticeship system lay with the master, aided by outside classes. Unfortunately, the rush of modern practice made the personal supervision of the principal practically impossible, or very rare. An apprentice was left to pick up what he could from the assistants in the office. He might see a great many fine working drawings made, and learn the routine of an office. He might see very little of specifications and kindred matters. He saw the results of his master's talent and experience, but learnt little or nothing of the principles or theory that had gone to the making of them. He became the follower, and carried on the tradition of a man and his work rather than of architecture in the wider sense. The old system was unfortunately still favoured for financial reasons by many architects, who sacrificed the future architect to the immediately useful draughtsman.

The new factor in the situation was the school of architecture either attached to a university, a school of art, or independent of either. There were at the present time seven such schools having a full five-year course of study, the later years combining some office training; the completion of the course to the satisfaction of the school authorities and of the Institute, who were represented by two external examiners, together with the passing of an examination in professional practice, gave the student exemption from the Institute examinations, and he became an Associate of the Institute. There were sixteen schools with exemption from the Institute Intermediate Examination. The number of students recently in the schools were: First year, 189; second year, 217; third year, 131; fourth year, 99; fifth year, 50—a total of 686. The schools were situated at the great centres of population and were gradually covering not only the British Isles but the Dominions overseas. They were new, and they were young. They showed the qualities of their condition, but they had, he believed, come to stay. One of the earliest pioneers of the schools, Professor Reilly, who had devoted the best years of his life to the founding and building up of the school system in general and the Liverpool School in particular, was of the opinion that it was a little early to pull them up by the roots to see how they were growing, or to expect much fruit from them; he agreed that the tree must be allowed time to establish its roots, but the fruit was not by any means negligible. It might be seen, for instance, in some students who had in recent years returned from the British School at Rome. The winners of that blue ribbon had without exception been products of the schools. It might be seen, too, in the results of recent competitions, notably in that for the Holt building at Liverpool. He spoke for himself, and he believed for the Board, in expressing the profoundest belief in the schools and in their future. The Board had recently appointed some of its members to make periodic visits to the schools to take counsel with the staffs and with those in authority as to how their needs and those of architecture might be best served, having regard to the locality and the students. The object was to help the schools in their special difficulties, not to standardise them. He thought they could not over-estimate the value of the freedom they had achieved by the exemptions granted to them from the examinations, a privilege that would be most jealously watched over by the Board.

The differences between the schools was a notable and valuable fact. They must have some standard of achievement, but it was not desirable that the system should be standardised. They wanted the teachers of the schools to visit other schools and learn what they could from them. Differences of thought, of ideals, of methods, were as marked in the schools as they were outside them; it was by what had been achieved and not by what had been said that posterity would ultimately value what was now being done.

There were architects who objected to the schools: some because they did not understand what they were doing and objected to a jargon which had unfortunately been adopted in some few schools when the use of the King's English would have aroused no feeling; others, and they must receive serious consideration, because they regarded the schools as too bookish and too theoretic; a few because the old system of apprenticeship was a pleasant source of income and comfort, and because they did not turn out immediately useful assistants. There was a time when young men left the schools with an exaggerated view of their attainments and value. They obtained a good salary and were found useless for the work for which they were paid. That, he believed, was becoming a thing of the past. A boy entering an office for the first time, unless he was engaged on the preparation of competitive drawings, realised that he was a new boy making a new beginning, his first duty being to get his master's ideas into material shape through the medium of the drawing board, a duty requiring accuracy and patience. On the other hand, the principal was finding that at the end of a year or six months such an assistant was more useful and had a greater grasp of the content and meaning of architecture than had the office-trained man.

In the education of an architect the question was: Are we awakening enough enthusiasm to carry the man through the drudgery to power and to freedom? In the early impressionable years of a boy's training and development there was, in his mind, no question of where the balance of advantage lay. In the one case he entered an office where he could take no useful part, nor was he capable of understanding the activities or interests of his fellows. In the other he entered a great school perhaps with ten, twenty, thirty or forty other freshmen. He was set to work with them in an ordered sequence of study, with a mind unconfused by factors and values relevant only to the prac-

tising architect's office. He had the healthy competition of students of the same year. The elements of draughtsmanship, design, construction, and history followed in an orderly procession, properly correlated and developed so that he might seize on their meaning and purpose. The strength of the schools lay chiefly in the method of teaching; in the personnel of the staff, who were mostly young and enthusiastic men, all of whom were actively engaged in private practice; and in the fellowship of the students of the same and of the senior years.

The school system at its best, as he had personally seen it at the A.A., at Liverpool, at Manchester, at Bristol, and he hoped and believed at many other schools which he had not yet had an opportunity of seeing, was the teaching of architectural design and construction concurrently in stages from the first year to an honours course in the fifth year. It was interesting to note that at Liverpool, where there was an honours course for fifth-year students that could be taken in either design or construction, those who took it in construction produced the best designs.

The method of teaching design had as its origin the great French school. The method adopted was that of M. Guadet, whose elements and theory of design and composition had been applied with so much success to the great school of modern architecture in the United States of America. It was noticeable that those schools which produced the best results were just those who encouraged by lecture and by quick, rough, small-scale sketches the study of design from the first year to the last. Every fortnight a programme was issued for some subject, large or small; the larger the subject the less the detail required; the first sketch was criticised. A number of such studies taught the student the right approach to a problem in design, to read the programme, to seize on the essential factors, and to arrange them harmoniously. It was only in the last years that a student worked out in detail a design for a building of any size.

There were few if any finished designs having initial and fundamental mistakes such as were so often seen in competition work. The students were taught the grammar of the art they were going to follow, so that they might hope to achieve that harmony of form running throughout each composition, both in plan, section, and elevation, that alone entitled the result to the name of architecture.

The schools, quite rightly, he thought, took up what might be described as a central position. They regarded the classics as the gold standard. The student was taught to look to these, Classical or Gothic, as the forms of utmost perfection. They were shown to be the forms to which they all constantly returned, and which, on returning, they always found more perfect than they thought. While he was being taught to delineate these forms he was being taught their application and the methods by which they were built. At the same time he was being lectured to upon the sources of art.

Some of the schools perhaps did not insist enough upon direct contact with the noble forms they held up to the student, because the school was not in a favourable position to do so. Like the schools in America, they had to fall back to a great extent upon books. He believed the professors of architecture held the view that the elements of architecture could best be studied from actual building and that composition could best be studied from books; the observation of the one teaching the relation of those parts that the eye could embrace, and of the other the beauties of composition in plan, section, and elevation, focussed into plates.

Sir Reginald Blomfield had said: "The reading of books will not make architects, his proper study will always be buildings." He (the speaker) did not believe there was any short cut in the matter; the study must be from buildings, and their beauty gradually unfolded to the student by his making his own measured plans, sections, and elevations.

It was interesting to note the difference of thought in the different schools; each school was working out its own salvation. Students' work to-day—in spite of the bewilderment that was felt at their lack of enterprise in entering for the great studentships and prizes which used to be so hotly contested—was in a far healthier and more lively state than it had ever before been.

Discussion.

Professor Richardson said the ideals of architecture changed from day to day. The architecture of buildings could be looked at from two points of view—the two roads. There was the road of tradition and the road of reason. Ultimately the two roads became as one, for reason was as intensive as tradition. The tendency of the present time was to encourage paper facility at the expense of the knowledge of realities. There was need for more discipline. Vital building must be the object of architecture. The training in architecture must be cultivated from the many activities that made up modern life. The chief objection to modern training was the subjects given to students during the first three or four years of training. The present system was making draughtsmen and not architects.

Mr. T. P. Bennett said those who were in charge of architectural education were in the position of selectors. They had to start their students with equipment which was sound and capable of development. They must have an intensive knowledge of construction and a clear appreciation of the properties of materials. In all periods, construction and design went hand in hand. Had they been contemporary with Gothic or Roman architects, they would have had to take construction as a basis of their work They could not attempt design without knowing the possibilities of materials. He would emphasise the composite nature of architecture. There was room for the play of almost every faculty—science, construction, law, &c.

After Mr. H. K. Stabell had spoken, Mr. P. L. Marks said he was very much against using foreign names when English could be used. With regard to development and construction, the principles of design remained the same, even with the use of steel and concrete. Dealing with the pupilage system, Mr. Marks said many architects used the system apart from the question of money.

Mr. Howdell said they were trying to bring architecture and construction together. The best way of training young men to-day was to begin with construction and alongside it study architecture.

Professor Beresford Pite said the opportunity ought not to pass without their telling their French brethren the great debt England owed France for her great traditional system and how much they admired it. But the efforts now being made by schools of English architecture weakly to copy and achieve badly motives of the great French method of national tradition was not worthy of their architecture. The results of attempting to do badly in England what was well done in France could be seen in the exhibition galleries. A few weeks back, in those rooms, drawings could be seen made by the masters of the great English schools of architecture of the last century. They were well worth careful attention. He was recently looking at a series of folios done by a Dutch School, and Mr. Slothouwer told him that after the first year students were forbidden to study work from the antique. Their foreign friends still had the view that Englishmen had their heads reversed—past instead of the future. Let them put the study of antiquity on a proper basis, and get to the motives that compelled the production of the Greek, Roman, and Gothic masterpieces. In these, the motives were intellectual. Let them come to a clear idea of where they stood, and see whether they could not employ similar motives. Let them study the problems of factory, town, and commercial architecture. Then they might find minds refreshed for spiritual buildings. Let them clear their minds of the cant of imitating the antique and their French neighbours. Then let them have a new heart and new ideas, and architectural education was not superfi fundamental.

Professor Anoni and Messrs. Howard R and Martin S. Briggs took part in the dis

Sir Reginald Blomfield, in conclusi he was glad to note that Mr. Emers stated architectural education should n mence too soon. Students often can educated or not educated at all. Mr. had given a clear definition of the Bea and it had produced brilliant architect buildings. But it was not suited country. They were different from the He would venture the criticism that architecture was a little mechanical, cold. Thirty years ago the Institute stirr on behalf of education, and came to the sion that apprentices and articles had h day. They should be more careful courage boys who had no qualities suit architecture. They would never rais tecture to its real height unless they v quality.

RECEPTION AND VISITS.

The Conference officially commenced on Monday, when the President and of the R.I.B.A. held a reception at street. Amongst those present were: H. V. Ashley, Harry Barnes, C. McArthu T. P. Bennett, H. T. Buckland, Wil Boring, Sir John Burnet, Messrs. Joh L. H. Bucknell, Martin S. Briggs, Bradshaw, Carl Brummer, L. B. Arthur C. Bossom, The Earl of Crawf Balcarres, Messrs. H. C. Corlette, W. E. Crompton, H. P. Cart de Lafontaine Davies (Board of Education), Arthur J Sir Banister Fletcher, Messrs. H. M. Cass Gilbert, W. Curtis Green, E. Stanle Vladimir Jezek, Francis Jones, Gilbert Arthur Keen, Walter M. Keesey, H. chester, E. Lallerstedt, Sir Edwin Messrs. Ian MacAlister, Oswald P. M T. Morison, Messrs. Ellis Marsland, Moira, E. C. P. Monson, Ragnar Ost Muguzuza Otano, E. J. Partridge, W. S. Sir Cooper Perry, Messrs. W. L. Black (P Penns. Chapter, American Institute tects), C. H. Reilly, Howard Robert John W. Simpson, Mr. L. S. Sullivan, Sir Selby-Bigge, Messrs. Evelyn Shaw Seager, Sir John Sulman, Messrs. C Skipper, J. C. Squire, D. F. Slothouwer, Sciortino, Jesper Tvede, Sir Brumwell The President of the Société des Ar Diplomés par le Gouvernement, Paris, T dent of the Royal Hibernian Academy R. Unwin, Frank Verity, J. H. Wor Edward Warren, Paul Waterhouse, Warwick, Sir Charles Walston, Messrs. E. Webb, Herbert A. Welch.

The conferences, some of which are this week, were held on Tuesday, We and Thursday mornings, the remaind time being devoted to visits to places of

On Tuesday the President and Coun Architectural Association entertained cheon those members of the confere were visiting the A.A. School of Arc and the Bartlett School of Architecture University, and at 2.15 p.m. a visit to the A.A. School. A series of films of processes, specially taken for the arch students, were shown. Afterwards the proceeded to the Bartlett School o tecture. From 4.30 to 6.30 a garden p held at Grosvenor House.

On Wednesday afternoon member conference travelled by river from Pier to Greenwich to see the work and Inigo Jones, and were conducted Royal Naval College by Mr. T. C. Architect to the College.

Yesterday afternoon a visit was pa British Empire Exhibition at Wembl

In the evening the Congress banquet at the Victoria Hotel.

To-day the members are to pay a visit to Cambridge, and for to-morrow day of the Conference, visits have been to St. Paul's Cathedral, the City chur British Museum, and Westminster A

COMPETITION OF NDUSTRIAL DESIGNS

RIVATE view was held on Friday last week North Court of the Victoria and Albert m of the designs received in competition e prizes offered by the Royal Society of or Industrial Designs. Particulars of this etition were issued and widely circulated end of 1923, and the prizes and subjects l extend over a wide field of industrial s. These prizes include Travelling Scholar- money prizes and " Owen Jones " medals. y large number of designs are exhibited, ny, in fact—there are more than a nd—that it is hardly possible to do more notice, here and there, a few examples of l interest. In the printing section a of title pages are shown which illustrate provement that has taken place in type- over recent years. No. 100, to which e of £10 10s. is awarded, though a good le, is not quite successful in the spacing e letters. The first three letters of vity " are detached from the more closely capitals of the remainder, giving the divided appearance, nor is the capital R d design. The awards are on the whole ctorily made, though the prize winners ot distinguished by any very decisive nce of merit from other examples not ng awards.

he Cadbury Bay, No. 220, by Miss Saul, active, but the advertisements as a whole ry poor. In the furniture (Sub-section 2) 9, R. F. Norton, shows " without reference ditional style " an interior treatment is successful. In Sub-section 3, No. 292, ch a prize is awarded, is lacking in dis- n. On the whole, the simplest designs s section are the best. The exhibition us that gramophones and wireless cabinets t easily lend themselves to sympathetic

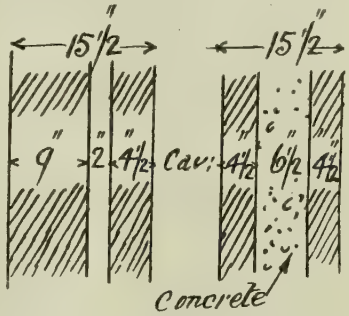
Cadbury's Bay the Owen Jones' medal is ed to F. Hilder for a spirited drawing of wich Park, which shows appreciation and ent. Sub-section 3, Textiles, presents h a large variety of designs for cretonnes, on the whole are very much what we are to seeing—a craftsmanship but little d by art and personal feeling. We d as agreeable in colour and design 77, Miss F. Gaskell, and 554. No. 29 ts all the opulence of Victorian Birds of ise and Victorian poppies, and the stuffy ations they connote.

he " Miscellaneous " Sub-section, No. 133 ut the best, but we cannot attribute discovery to the chocolate boxes shown, onfess to finding much of this section rdinarily tedious. In Bay No. 37, Nos. 34, 532, 524, 362 should be noticed, some embroidery exhibited being very charm- A nicely embroidered tea-cosy may be since we must suffer these domestic s. The exhibition is in a sense dis- ting, and as is to be expected, much ed by the fashion of the time, and reflects aracter. Chocolate boxes and advertise- for chocolates not affording, perhaps, for more than this. It cannot be said his exhibition gives evidence of any new us, but is rather the reflection of its own and its present influences. Encourage- of art appears to come in other ways through such competitions, though they ave their use in stimulating the young to ty. We shall be nearer to understanding roblem when we appreciate how difficult There appears a levity almost in such ement as that which follows—we quote the Draft Report—" The regrettable gulf has opened between art and manufacture be bridged without delay." But how ? man by searching ?—If we seek the right , set out hearts to care for them, there ns no problem about art, nor any gulf to , because it will come of itself, being only xpression of life lived and employed in oblest ways. So long as we hold back part of the price will the gulf remain, and pious phrases do not help us. Perhaps in thinking more and organising less there may come to us a new witness for art, which our hurry to regain " pre-eminence in commerce " hardly aids us towards.

Among the prizes awarded were the following :—

Textiles.—(£10 10s.): E. E. Taylor (School of Arts and Crafts, Battersea Polytechnic).

Furniture.—(£10): H. S. Froude (School of Art, Goldsmiths' College) (No. 429); E. H. Hill. The Travelling Scholarship of £125 was awarded to E. H. Hill.



ARCHITECTS' AND BUILDERS' INQUIRY BUREAU

***** We are glad to give questions and answers but cannot accept responsibility for contributed replies, especially on legal matters.*

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or better still, in typescript?—ED.

Cost of Building Hollow Walls.

SIR,—Could any of your readers answer the following questions :—What is the comparative cost of building the two walls shown in the diagram ? What is the cost of building an 11 in. cavity wall as compared with an 11 in. wall

with 2 in. of hygeian rock instead of a cavity ? I presume that, with the concrete filling, ties would be necessary, but not with the hygeian rock. Is this correct ? How would the use of special bonding bricks instead of iron ties affect the cost of building a hollow wall ?

" M. D. R."

Housing Subsidy.

SIR,—We have a house on which a subsidy has been granted under the Housing &c. Act, 1923.

The purchaser to whom the subsidy has been granted is unable to take it up owing to unforeseen reasons. We have applied for the subsidy to be transferred, but this the local authority are unwilling to do.

Is there anything in the Act prohibiting the house being occupied for a short period by the original purchaser after granting of subsidy amount and then being disposed of to any other purchaser ? " PERPLEXED."

Cowhouse Floors.

SIR,—The best arrangement is to provide a concrete platform raised about 4 in. to 4½ in. above the general floor level, the step being under the tails of the cows with a shallow gutter running along under same and draining into stable gullies. The portion next the trough, for a width of about 2 ft., should be of soft material, such as earth or peat, so as to avoid bruising the beasts' knees when lying down, the remainder being paved with granolithic laid to falls and grooved for drainage and foothold. " PAVIOR."

Architects and Local Authorities.

SIR,—I am a member of an Urban Council, and as such I am a member of the Sanitary and Highways Committee which deals with plans. As architect, on behalf of clients, I often have to submit plans to this Committee, and the Clerk informs me that as I am an interested party I am not allowed to take part in the discussion on these plans, nor yet am I allowed to vote in any way. I would have thought the Clerk was right *re* my not being allowed to vote, but I am of opinion that I should be allowed to join in the discussion. I shall be glad to have your opinion on this matter.

[REPLY.]

[We are unable to trace previous rulings upon the subject, but we are not aware of any law limiting the powers of interested members of Urban District Councils, once elected. As a matter of public policy, however, we should have thought a Committee man would be very careful to take no more active part in the discussion of his own plans than is open to any ordinary member of the public.]

Artificial Daylight.

SIR,—Can any reader inform me of the best form of artificial daylight that can be produced for the " trying-on " rooms in a large high-class drapery establishment ? " DESIGNER."

Contract Forms.

SIR,—With regard to the R.I.B.A. Model Form of Agreement and Schedule of Conditions, I find it somewhat puzzling to fill in the blank spaces, especially paragraph 30 (certificates and payments), from the words ' until the balance in hand " to the end of the paragraph. I wonder if any reader will kindly give an example to an assumed contract amount of, say, £1,130.

Also, what would be a reasonable figure to fill in in paragraph 26, " If the contractor shall fail for . . ." ?

Further, what lengths of time is reasonable for the blanks in paragraph 31, A and B ?

" RAJAH."

Ceiling Lining.

[REPLY TO P. W. A.]

SIR,—P. W. A. should get in touch with a good firm of asbestos goods manufacturers, who will be able to advise him of some form of their material that will meet his purpose.

" M. A."

Insulating.

[REF. H. N. I.'s LETTER.]

SIR,—Further to H. N. I.'s letter upon the above subject, though I do not think for a moment that the original querist will have been misled by my statements, I should like to explain that in referring to the air in a sealed cavity as " stagnant," I intended the term as relative only to the pronounced circulation in a ventilated cavity. Similarly as to its non-conductive qualities, I did not suggest that alone it was a thoroughly sufficient insulator, but merely a very useful auxiliary to the properly constructed insulating shell of the wall. A cushion of air does check the transmission of heat, and this fact is the secret of the warm feather bed. " L. X."

Provisional or P.C. Amounts.

In fixing a provisional, or P.C., amount of, say, £20 (in an architect's specification) for certain goods to be obtained from a specified firm, whose name and address is given, would the architect be responsible to that firm for payment, supposing that goods had been ordered by the builder and yet not paid for by him, even if the final certificate of payment to the builder had been made for carrying out the contract work? I have been given to understand that specifying P.C. amounts or provisional sum and the name and address of the firm to whom the builder must purchase from, makes the architect liable if the builder has not paid the firm's account.

" ARCHITECTUS."

PROGRESS OF THE HOUSING BILL

THE Housing Bill passed the third reading in a small House by a majority of 95. It is, of course, inevitable that in the House of Commons the discussion must proceed upon political lines, but in a measure such as this politics really tend to obscure the main issue, as every objection is treated as only raised to further one or the other political end.

There are objections to this Bill which are in no way political, and the main objection is that it indicates an end to be attained, but fails in any way to supply the means. The old Jingo war cry of some forty years ago "We've got the men, we've got the ships, and we've got the money too," paraphrased and applied to this Bill, would run "We've got no men, we've got no bricks, but we'll vote the money through." There is the great objection to such a measure that it upsets the market, it tends to render money and material dearer, and yet in the immediate future it cannot be put into useful operation for the lack of men and materials.

It is an emergency in which, to carry on the nautical phrase, "all hands should have been piped on deck," but although some slight amendment has been made in the Bill during its passage through the House, private enterprise has been neglected and scoffed at. The Parliamentary Secretary to the Ministry of Health is reported as having said that the logical way of dealing with the housing problem on the lines of private enterprise would have been to repeal the Rent Acts and allow rents to rise, but the former Government had lacked the courage to do this; and the Minister spoke as though private enterprise was only greedy enterprise requiring to be controlled. Private enterprise was put in fetters early in the war by rent restriction, and despite its fetters it has given an excellent account of itself under the Act of 1923, and it certainly has not been making excessive profits.

Mr. Wheatley in the debate adopted the same tone towards private enterprise, and is reported as having said that the figures given by Sir W. Joynson-Hicks with reference to the Act of 1923 were most misleading, but our readers will be able to judge of this by the figures given by Mr. Wheatley himself, which we published in our article of July 4, which showed the important part played by private enterprise under the Chamberlain Act.

The real gravamen of the Minister's charges seems to be that under that Act no houses were offered to tenants under agreements of letting, but how could they be when rent restriction continues to place rents on an artificial basis owing to the competition of restricted houses. The Government talk as though they were restraining the greed of private enterprise and restoring economic rents to the nation, but what they are really doing is merely to subsidise houses for the working classes at the expense of the tax and ratepayers over a long period, and thus further to close the open market and to create a new class of privileged tenants. If the end to be secured was to provide houses for letting this could surely have been accomplished in connection with the existing Acts, and on a scale which did not commit the nation to so vast an expenditure over so many years at a time when it is impoverished.

If the Bill is to become law we wish it well and trust it may be more successful than we imagine will be the case, and it certainly is now a somewhat different measure in minor respects to what it was when it was first introduced, but without any hostility we have felt compelled to criticise in its passage through Parliament and to combat the attacks which have been made on private enterprise in building which, we predict, if given a fair chance, will still prove the best and most economic agency for the production of the much-needed houses.

In continuation of our review of the proceedings in Committee on the Housing Bill, we may note that on July 18, in proceedings reported after our last issue went to press, other amendments were accepted in connection with Clause 3.

The Minister accepted an amendment that in the letting of houses built by the local authority reasonable preference should be given to large families; also an amendment setting forth the special conditions applicable to houses erected by private enterprise and public utility societies. An amendment was also accepted that "the appropriate normal rent" charged shall be exclusive of rates. The Minister also accepted an amendment which provided that the rules made under Clause 3 sub-clause (3) with respect to "normal rent" should be laid before both Houses of Parliament as soon as may be after they are made, and that if an address be presented by either House within twenty-one days praying that a rule should be annulled, His Majesty in Council might annul the rule without prejudice to anything previously done thereunder.

Before passing to the proceedings in Committee on Clause 4 we will refer to one or two new clauses introduced at the sitting of July 21 to meet pledges given at previous sittings. The Minister moved the following new clause: "In any case where the Minister certifies that a local authority has failed to take the necessary steps for promoting the construction of houses under the Housing, etc., Act, 1923, or this Act the provisions of Section 3 of the said Act of 1923 shall apply to persons willing to undertake the construction of houses in the area of the local authority in like manner as they apply to the societies bodies of trustees and companies therein mentioned and the provisions of this Act relative to such societies, bodies and companies shall extend to such persons." This clause was read a second time, but Sir C. Starmer moved an amendment to it making it retrospective by bringing in persons who had already commenced building houses but were unable to complete them because they could not get the subsidy owing to the local authority failing in its obligations, and this amendment was carried against the Government.

On July 21, when the Committee resumed its sitting, clause 4 was considered, and on an amendment moved by Sir G. Macrae giving the Government power to withhold the contribution "in the absence of adequate arrangements for the necessary increase in the supply of labour and materials at reasonable prices," the Minister made a long statement in which he began by admitting that he did not question the statement of the mover of the amendment that we had not an adequate supply of men and material to ensure the desired number of houses, but added that he was concerned that the means should not be magnified into greater importance than the end. But surely this is an example of putting the cart before the horse, and in connection with a scheme of colossal magnitude involving huge sums and effecting the whole credit of the nation? Why has such an ambitious scheme been framed at this time, when the means to carry it into execution are entirely in the air? The scheme was put forward as an assured scheme, adequate provision having been made both for its continuity and for the provision of men and materials, but the whole speech of the Minister showed how far this was from being the case. The guarantee for fifteen years to the building trade which was promised was not contained in the Bill as originally framed, and has now entirely gone by the board, for the Minister accepted an amendment to clause 4 enabling the Government contribution to be withdrawn in the event of the specified number of ho not being built "whether the deficiency is to the absence of adequate arrangements the necessary increase in the supply of bu ing labour (including any necessary augme tion of the number of apprentices employ or for the necessary increase in the suppl materials at reasonable prices or from other causes whatsoever," so where is necessity of this grandiose programme bin the nation for some sixty years? What assurance had the Minister to offer that scheme would ever be carried out? He c only assert that he hoped a more speedy t ing for apprentices could be devised, and more bricklayers' labourers would be avail but on this latter point he had, he said data which would justify him in presentin estimate to the House. The rest of his spe as reported, only amounted to pious hopes better methods of production could be fo and he even mentioned some new system was about to inspect.

We sympathise with the Minister, wh doubt is placed in a position of difficulty with unemployment so with building, his p came into office with the assertion that had remedies cut and dried for both probl and something had to be done. They co trated on building, and produced a Bill in nature of a pageant which should dazzle eyes and stimulate the imagination, but it comes to be applied to existing facts seen to be more suitable to the cinema to actualities of existence. The sch depends entirely upon the possibility of curing men and materials under present ditions. The subsidy is based upon those ditions, and it is no use hoping that new and new methods may be discovered to m it a possibility. Measures involving expenditure carried on over generations ca be launched on visionary principles, an they are they are foredoomed to failure. can the House of Commons vote large sum money and pledge the credit of the authorities for years to come, when admit the actual conditions do not admit o scheme being carried through, and it can be possible if any new methods of con tion can be found? These new methods go to the very root of the principle on the proposed subsidies are based, and if argued that after all the scheme is but e mental and can be abandoned, what be of what has been asserted all along to b basis of this scheme, the long guarant the building trade which was to offe incentive for the members engaged in that to be increased? Before embarking up long term programme, as is the case embarking upon a war, the men and materials must be assured. It may be r that in the late war we were forced to e with neither assured, but we may remin Government of the result—conscription to be resorted to. They have cer shown no signs of desiring to resort to scription in the building trade, or ev induce the trade unions to relax their so as to increase the number of men; a Government has really done so far is t the money.

In the debate Sir W. Joynson-Hicks that the Birmingham Housing Committe scoured the country and could not procu labour to erect the houses they had a authorised, yet under the Chamberlain some 50,000 houses only were being buil also stated that he had inquired fro Ministry of Health how much extra lab would take to build another 100,000 h and the reply had been 50,000 brick 7,000 plasterers, and 1,700 slaters. A ficient comment on these figures is a by the Bill, which schedules the num houses to be completed in 1925-6 at 1 and in the years 1928-9, 255,000. The s depends on two-thirds of the number of being completed (a period of three yea the two years last preceding and in res which contributions are payable set o

res for two years contained in the . Even the apprentices will not be ntil the year 1928.

ning to the proceedings in Committee, clause moved by Sir C. Cobb was to the effect that "any expenses by the London County Council under and under section 2 of the Act of mended by this Act shall be defrayed ses for general county purposes," the ing to secure that the City of London ntribute its proper share to the main scheme for London.

clause proposed by Mr. Masterman Minister of Health should in future h a condition that a trust or combine formed by shutting out foreign com- in building materials, and that no should be placed upon the provision s by any new and cheaper material se at present used, was not pressed Minister said he intended himself clause the effect of which would be freedom of purchase in the cheapest t home or abroad, and that if the of Health was satisfied that a par- ind of material was suitable for house and local authorities insisted upon with the older and more expensive the unnecessary expenditure incurred t rank for subsidy.

clause moved by Sir H. Nield for sion to County Councils of the powers upon local authorities by the Act of accepted by the Minister.

inister desired to accept a new clause by Mr. Paling to the effect that where provided by a colliery or other for which a subsidy was given was by a person in the employment of the the latter should not be able to ossession by notice to quit or re-entry e payment of an increased rent by f the tenant ceasing to be in their ent. This proposal was made at a g, and would seem to suggest dreams t restriction Bills, but the House was ugh awake to reject the clause by a of 96.

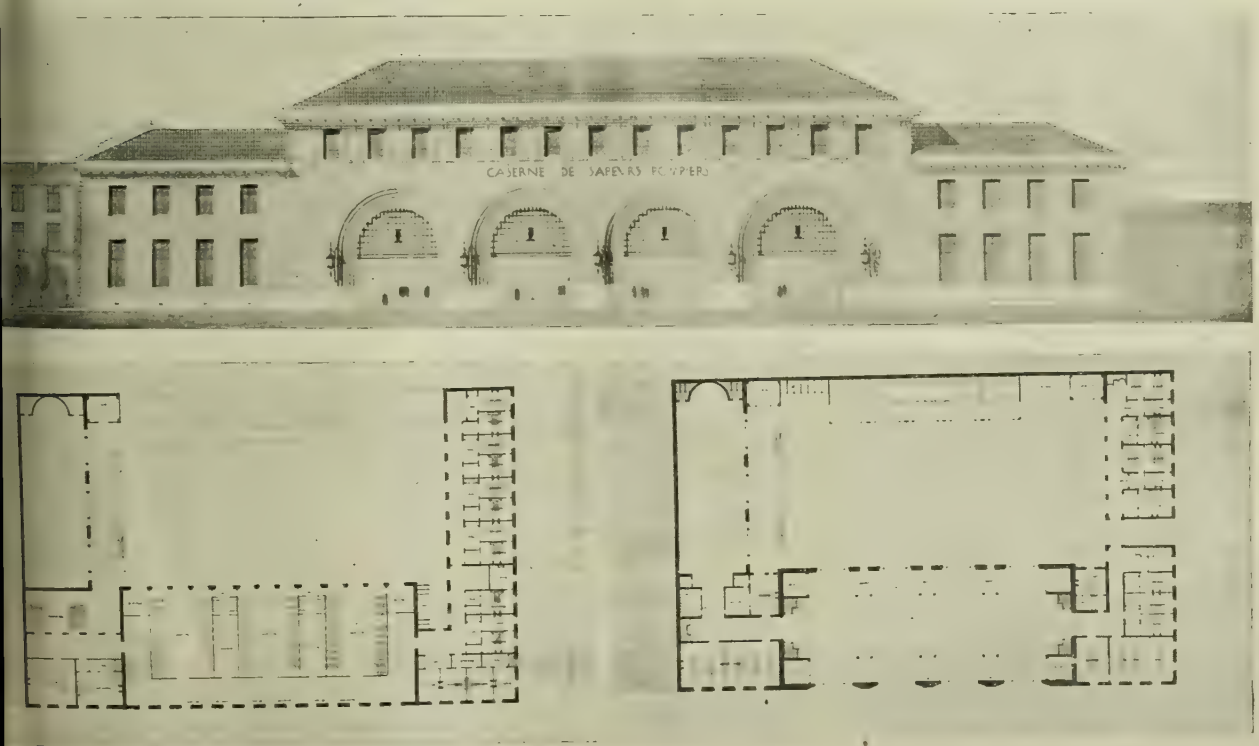
Report stage discussion took place on dment, designed to prevent tenants et with the consent of the local authority king anything in the nature of "key and a clause introduced by the Govern- that in giving or withholding such regard shall be had to any payment or other consideration received, or to be received by the tenant," it was contended did not go far enough, and an assurance was given that the effect of this clause would be further considered as the Government was in full agreement with the House on the point involved.

An addition was made to the amendments already passed on Clause 4, enabling the Minister to withhold contributions in cases where the deficiency of houses was due to the absence of adequate arrangements for the obtaining of funds at reasonable rates of interest to finance the provision of houses. Clause 4, subclause (3) was amended on the motion of the Attorney-General. The clause reads: "When any such order (that is, an order that no further contributions shall be made) has been made the Minister . . . shall not be liable to make or to undertake to make any contributions in respect of houses which have not been completed before the date specified in the order," but the amendment adds the words "other than a house which is completed not later than eight months after the specified date in respect of which the Minister or Board is satisfied that the failure to complete the house before the specified date was due to circumstances over which the local authority, person or body constructing the house had no control."

The report stage of the Housing (Financial Provisions) Bill was taken in the House of Commons, on July 24.

In order to give effect to a promise he had made in Committee to Lieut.-Col. Fremantle and others, Mr. Wheatley moved the following new clause: "It shall be the duty of a local authority, on submitting proposals for the provision of houses for the purposes of this Act, to satisfy the Minister (*a*) that they have taken into account the requirements of any town-planning scheme likely to be made in respect of or in the neighbourhood of the area in which the houses are to be provided; and (*b*) that the rate of density of the houses, ascertained in such manner as the Minister may determine, will not, except with the consent of the Minister, exceed eight per acre in an agricultural parish and twelve per acre elsewhere."

Mr. Greenwood, Parliamentary Secretary to the Ministry of Health, explained that it was clearly the intention of the clause to give the Minister power, where there were special circumstances and where it would be practicable to build more than twelve houses to the acre, to do so. There were no legal powers of compulsion on areas of less than 20,000 inhabitants in regard to town-planning, but this clause would promote town-planning in the smaller towns, and the Ministry would do all it could to help in the matter.



The new clause was agreed to.

The following new clause, moved by Mr. P. Harris, was agreed to: "Where the Minister approves the proposals of a local authority in relation to the provision of houses in the area of another local authority, and any difference arises between those authorities with respect to the carrying out of the proposals, such difference may be referred by either authority to the Minister, whose decision shall be final and binding on the respective authorities."—Mr. Gilbert, who seconded, said the new clause particularly applied to London, where the L.C.C. had to go outside the county in order to put up housing estates. The standards of many of the local authorities were quite different from the standard of the L.C.C., and, as had happened in the past, it was very desirable that arbitration should be allowed as proposed by the new clause.

On Clause 1, Mr. Wheatley, in fulfilment of a promise given in Committee, moved an amendment giving local authorities power to purchase houses from persons who had erected them before the passing of the Act without having gone through the ordinary process of a contract with the local authority. When the Bill became law, he would issue a circular to local authorities, drawing special attention to this provision.

The amendment was agreed to, as was also another amendment moved by Lord E. Percy providing that where proposals were submitted to the Minister which, in consequence of the adoption of new materials or new methods of construction, involved a reduction in the cost of each house substantially greater than the equivalent of £4 10s. per annum for forty years, the Minister might reduce the contribution by such amount as he thought just and reasonable, provided that such reduction should not be so great as to impose any burden on the local rate, or on a society, body of trustees, or company providing the houses.

A further amendment agreed to was moved by Sir C. Cobb to enable Borough Councils in London carrying out small schemes of slum clearance to enter into agreements with the L.C.C. for the building of houses in which to re-house the people who were evicted.

A French Exhibit at Grosvenor House.

An amendment dealing with the sub-letting of houses was agreed to. It provided that the local authority, in giving or withholding consent to sub-letting, shall have regard to any payment or other consideration received or to be received by the tenant. This was designed it was explained, to prevent sub-letting at a profit.

Another amendment was moved on Clause 3 by Mr. Greenwood. It lays down that the rent to be charged by public utility societies, companies and other bodies shall not exceed the appropriate normal rent, together with a sum equivalent to the average excess, if any, above the appropriate normal rent which could be charged by a local authority for the houses provided by them.

After discussion, the amendment was agreed to.

On Clause 4 Mr. Franklin moved an amendment entitling the Minister of Health to make an order withholding the subsidy in cases where the deficiency in the number of houses was due to the absence of adequate arrangements for the obtaining of funds at reasonable rates of interest to finance the provision or acquisition of houses. After the words "or acquisition," which Mr. Wheatley said were unnecessary, had been deleted, the amendment was agreed to. The mover explained that the amendment would be a warning to local authorities not to go beyond a certain point in competing for money for housing schemes and a notice to those lending the money that there would not be a constant rise in the rates due to competition.

The Attorney-General moved to add to the end of paragraph (3), which provides that when an order has been made under this section, the Minister shall not be liable to make contributions in respect of houses which have not been completed before the date specified in the order, the words :—"other than a house which is completed not later than eight months after the specified date in respect of which the Minister or Board is satisfied that the failure to complete the house before the specified date was due to circumstances over which the local authority, person, or body constructing the house had no control." The amendment was agreed to.

The Bill was then recommitted in respect of certain amendments dealing with agricultural parishes. Ultimately, on the motion of Mr. Wheatley, an amendment was agreed to altering the definition of an agricultural parish which will rank for the higher subsidy of £12 10s. from one in which the net value of the agricultural land exceeds one-third of that in the parish to one in which it exceeds 25 per cent. of the total net annual value.

The Bill, as amended, was then reported to the House and the report stage finally concluded.

The third reading was taken on Friday, July 25. The rejection of the measure was moved, on behalf of the Unionists, by Mr. S. Roberts, as follows :—"That this House declines to give a third reading to a Bill which calls for a greatly increased subsidy without any security that it will provide houses at rents which can be paid by the poorer section of the community, and which purports to arrange for the erection of greatly increased numbers of houses without any guarantee that the necessary additions of labour and materials will be forthcoming." Sir P. Pilditch seconded, and the Unionist criticisms chiefly followed the lines of the motion. Sir J. Baird, the former First Commissioner of Works, suggested that the Minister of Health might well turn his attention to new methods of construction, and appeared to be in favour of a scheme of national production of houses by unskilled labour on the lines on which the shell shortage was solved.

Sir W. Joynson-Hicks made a strong defence of the Chamberlain Act, but this was severely criticised by Mr. Wheatley, who, replying to the debate, stated that the present housing shortage was worse than when the Chamberlain Act was passed last year. In answer to a suggestion that he should offer an attractive prize for the people who could do something in the way of producing the right type of house, the Minister said that one of the things he proposed to do immediately the Bill became law was to organise an exhibition of housing so that everyone might have the opportunity of showing to the nation what he could do in the way of building houses. In conclusion, the Minister admitted that the country was not yet ready for Socialism, and, in the meantime, he had to take things as he found them. He had submitted a Bill which he believed would succeed in solving the housing problem.

The third reading was carried by 226 votes to 131—Government majority, 95.

The Bill was formally read a first time in the House of Lords the same afternoon.

The Bill was read a second time without a division in the House of Lords on Tuesday. The Committee stage has been fixed for next Monday.

An interesting suggestion was made during the debate by Lord Weir, who advocated the principle of standardisation. He said that the most suitable materials for the main structure of houses would be a combination of timber and steelplate. The use of these materials would eliminate the bricklayer, while a multiple production of timber units, with the use of gigs and other methods, would make them independent of the skilled joiner. The inner walls and partitions would be lined with wood or composition board, and no slaters would be required. The use of either metallic shingles or asbestos sheets for roofs would not involve the employment of plasterers. By standardising the layout, all the pipes and electric wiring could be produced by factory methods, independent of the plumber and electrician. By the standardisation of equipment and fittings, the problem of baths, sanitary conveniences, &c., would be rendered much simpler. Thus the middleman would be eliminated and costs reduced. These principles of production had been applied with complete success in war time, and he had no hesitation in saying that if his scheme were applied on a sufficiently large scale, a three-roomed house, with scullery and bath-room, but exclusive of lands, roads, drains, could be erected at a cost of under £300. The Government should lay down an auxiliary scheme to provide 500,000 houses in the next five years by a system of standardized production.

Lord Middleton gave notice that, on the motion for going into Committee on Monday, he would move that the Government institute an inquiry into alternative methods of building.

THE WEEK IN PARLIAMENT

WESTMINSTER, *Wednesday.*

Progress under 1923 Act.

Mr. Wheatley informed Sir W. Joynson-Hicks that the following statement showed the position of housing schemes under the Housing &c., Act, 1923, on the under-mentioned dates :—

(I) Houses authorised by the Minister of Health, up to July 9, 1924 :—

To be erected by local authorities..	52,198
To be erected by private enterprise..	96,685
Total	148,883

(II) Houses included in definite arrangements, on or before July 1, 1924 :—

Schemes of local authorities—	
No. of houses included in contracts or in approved direct labour schemes	32,793
Private enterprise—	
No. of houses included in undertakings given by the local authorities under Section 2 (3)..	62,492
No. of houses approved by the Minister under Section 3 and included in contracts..	4,842
Total (included in Table I)..	100,127

(III) Building Progress at July 1, 1924 :—

	Foundations completed.	Roofed in.	Total under construction.	Con
Schemes of local authorities.. ..	8,222	6,126	14,348	6
Private enterprise	16,120	14,182	30,302	11
Total houses (included in Table II)..	24,342	20,308	44,650	17

The Addison Houses.

Mr. Wheatley informed Mr. J. Jone the numbers of houses completed in eac from 1919 to 1923 under schemes auth by the Housing Acts of 1919 were as follo 1919, 100 ; 1920, 15,711 ; 1921, 86,669 ; 89,001 ; 1923, 15,679 ; total 207,160.

Of these 167,922 were built by local auth and 39,186 by private enterprise

Hoardings for Bill-Posting.

Mr. R. Wilson asked the Minister proposed to introduce legislation to m illegal to erect hoardings for bill-posting w the consent of the local authorities, an to give these local bodies power to requ removal of existing hoardings deemed undesirable.

Mr. Wheatley said there was already before the House to give local auth greater power in regard to hoardings, a could not undertake to introduce any f legislation on this subject at present.

Building Lines.

Lieut.-Commander Kenworthy aske Minister of Transport whether it was pr to prohibit the building of houses, &c., a certain distance of the new arterial and whether he would consider taking to prevent the sides of new roads bei figured in the country districts by adverti hoardings and signs.

Mr. Gosling said in the present state law it was impossible to ensure the prescription of adequate building lines, was considering in conjunction with the M of Health what additional powers were re for this very desirable purpose. As re unsightly hoardings, he believed a Bil the House of Lords aiming at an exten the powers of local authorities in this was now before one of the Standing Com of the House.

Charing Cross Bridge.

Mr. Gosling informed Viscount Curz he was acquainted with several proje a new bridge at Charing Cross. The mat one of great importance and would be c studied by the Advisory Committee to up under the London Traffic Bill.

School Building Survey.

During the discussion on the Board of tion Vote, Mr. Trevelyan, the Presider he was having a complete survey made, the autumn he would make clear what buildings would be allowed only a limite of existence. Some would have to demned outright, and others recons Our greatest need was more school bui

A Suggested Inquiry.

Sir K. Wood asked the Prime whether he would cause an inquiry to into the charge that building employ recently added to building contracts, May 1, the equivalent of an increase i which, in fact, had not been paid ?

Mr. Greenwood said it was not thou any good purpose would be served by inquiry. It would be very lengthy reaching, and it is very doubtful whether lead to any definite results. He was that the prices in building contracts wi knowledge of the Ministry of Health months of March-June inclusive did not any such action generally on the part tractors as was suggested.

Single-room Tenements.

Mr. Greenwood informed Mr. Ald according to the 1921 Census, which f the most recent figures available on the there were 317,417 private families in and Wales occupying one room or les the aggregate number of rooms occupied being 317,260.

THE BUILDING TRADE

SUGGESTED METHOD OF OBTAINING STABLE BUILDING COSTS

By "ESTIMATOR."

s is no doubt there is considerable action with the position of labour in ding trade to-day. The workmen are ing that the sum total of their wages cient, and the employers grieve at the t of production. It would, therefore, be an urgent problem to discover some which the worker can receive higher d the employer lower or more stable fter all, it cannot matter what system nt is in vogue so long as the workman ts the higher wages and the employer isfactory costs.

thirty years ago there was a good deal gossip in some districts with regard to rd cost of production. In one place erers were discussing what should be lard rate of production per hour. The en were about 9d. per hour, and it was l by some of the men that the standard yard super of "render, float, and set," e 9d., *i.e.*, one hour per yard. To this ployers demurred as the piece-work he above mentioned type of work was l. The matter ended, as all gossip oes. The opinions canvassed were not tive, merely local, and no importance e attached to them.

s seem that in the case of buildings of ion character there is no reason why rd cost of labour should not be fixed arious items in housing by the parties d, the employers through their associa- d the workmen through their unions. ll be no advantage to either employer yed in such a case unless the workmen higher wages and the employers lower stable costs. Under an agreed system lts could be achieved.

andard rate of work being settled, if were done in less time the workmen t all the difference as extra wages over ve the standard rate, and in the event uantity of work falling short of the that would be the employers' loss, vorkmen would be paid the standard ages in any event. To put the matter s, if the standard rate of bricklaying per day and the craftsmen laid 900 in e, he would receive in addition to his wages the value of laying 100 bricks schedule rate. Thus, the workman et higher wages and the employer t some approach to uniformity in his costs. Both would have one common view.

lowing abbreviated or skeleton schedule ve some indication of the lines on which lard rate of production would have to ıt and agreed.

EXCAVATOR.

Excavate to form trenches and fill into cart.
Add for wheeling.
Labour mixing concrete and filling into trenches and levelling.
Labour mixing, spreading, and levelling concrete over site 6 in. thick.

BRICKLAYER.

Reduced brickwork left for plastering.
Do. faced one side with red facings.

Raking out and pointing brickwork in cement.
No. 1. Bedding and pointing door or window frame.
No. 1. Fixing and setting stove in chimney piece.

CARPENTER.

Ft.	
— cube	Labour fixing ground joists.
— ,,	Do. fixing first-floor joists.
— ,,	Do. fixing roof timbers.
Squares.	
— sup.	Laying 1 in. flooring and cleaning off at completion.
	No. 1. Hanging door and fixing hinges.

PLASTERER.

Yds.	
— sup.	Render, float, and set on brickwork.
— ,,	Do. on lath.
Ft.	
— run	Labour arris.

The appropriate rates to be paid for labour for the particular items are not stated, as they would depend in a measure upon local conditions, and would be required to be settled between the local employers' association and the unions or body of workmen concerned.

When rates are definitely fixed there should not be any alterations allowed for a definite period. This would give the workmen some guarantee that if they did their best to give a large output they would not be subsequently victimised by having the standard rate almost immediately fixed against them unless, of course, some new method were invented of doing the work.

This system would involve some measuring up of the work performed which could be done by the employer at settled periods, say, once a week or once a fortnight. If the work were of a repetition character when once a unit or house was measured it would probably suffice with few variations for a whole estate. In the event of the workmen objecting to the measurements offered, the employers' association could have a rota of recognised surveyors who would adjust the matter, and the fees—which would be very small, as the amount in question would not be large—would be paid by the party in fault. The workman himself would get the standard rate of wage in any event, and therefore could not possibly lose anything by some such system.

In a job where several men of the same trade had to be employed they would have to share with the bonus, and this would also apply to the labourers.

As before mentioned, the agreed rates for labour would have to be arranged to suit local conditions and the particular job in question. For instance, some brickwork jobs would require the attendance of one labourer to each bricklayer, or perhaps two labourers to three bricklayers, and in exceptional cases it may be found that one labourer would serve two bricklayers. The workmen would probably dislike having anything to do with measurements, but this could no doubt be arranged provided their interests were safeguarded as indicated above.

Again, it may be asked why should the workmen getting an assured standard rate of wages trouble himself to work harder with a view to receiving a problematical bonus. This may be the real difficulty in the matter, and could probably be met by the employer conceding an additional penny per hour to men who were undertaking the standard time work. The employers would probably object to the latter suggestion as they would not know where it would lead.

Some objection may be raised to the whole scheme on the grounds that it would offer a bonus to the young and vigorous mechanic and probably penalise the older man. This would not happen in practice, as the older men have usually a niche of their own in the trade which newcomers do not fill. If some such scheme were adopted for houses it would be probably difficult to apply to commercial buildings, which would have to be dealt with separately.

That there is need for some such standard of output for labour is evident when it is stated by employers in some districts that bricklayers are only laying 300 bricks per day while builders in other districts have workmen who are laying 1,000 per day. In some trades outside the building trade (textile and others) there is a schedule of prices fixed for the various detailed operations connected with industries, which is subject to increase or decrease as the wages rise or fall, and if it is possible to fix such a schedule in other trades, why cannot an attempt be made to introduce the arrangement to the building trade ?

These schemes do not debar the workmen from striking, and they could still do so for the various reasons for which strikes are arranged at present, but the desire to strike would be lessened.

The above-mentioned method has been tried in the past and has been found to work satisfactorily. When a standard rate of production has been fixed something must be done to grade workmen according to their skill in the industry and pay them in accordance, as the skilled craftsman is getting tired of being paid at the same rate as the inferior workmen, and this is undoubtedly the cause of a great deal of the present unrest.

L.C.C. and the Housing Bill.

The Housing Committee of the L.C.C. suggest that, in the event of the Housing (Financial Provisions) Bill becoming law, steps should be taken to enable effect to be given to the proposals in the Bill. They ask the Council to agree to a capital estimate of £500,000 in order that the construction of 20,000 houses may be proceeded with, as and when opportunity affords and supplies of labour and materials are available, subject to the Council receiving a State subsidy of £9 a year for forty years in respect of each house, and to the loss in respect of each house being limited to £4 10s. a year for a similar period. The committee also recommend that the development of land in the Ilford section of Becontree should be proceeded with, the cost being put down at £521,850.

Strand Widening.

The L.C.C. Improvements Committee recommended last Tuesday that application should be made in the next session of Parliament for compulsory powers to acquire the principal interests in the block of property between George-court and Villiers-street, and extending from the Strand to York-place, in order to continue the Strand widening. The estimated cost of acquiring such interests, other than those already acquired by agreement, is £450,000, a substantial portion of which would, however, be recoverable by the sale of surplus lands. It has been the practice of the Westminster City Council to bear one-sixth of the net cost of widenings in the Strand, and the Committee proposed to communicate with that body with regard to these proposals. The removal of the property will enable the Committee to bring that part of the Strand to the new width of 80 ft.

Development at Scarborough.

Purchased some time ago, the Scarborough Aquarium is to be remodelled by the Corporation. The total estimated cost is £104,170. The scheme includes the provision of medical, Turkish, slipper, and two swimming baths; the remodelling of that portion of the original building which is under the roadway; providing a concert hall and theatre, cafe and shop; and constructing public lavatories and a permanent beach-bathing establishment, which will necessitate the construction of a new sea-wall.

THE BUILDING TRADE DISPUTE

By S. STRANKS (*Organiser, Amalgamated Union of Building Trade Workers.*)

[While we are pleased to give publicity to the operatives' opinions on the present dispute, we do not necessarily agree with all Mr. Stranks says in this article.]

It is said strikes settle nothing. As wars between nations mean a resignation to the use of power as against that of reason, justice is not the deciding factor in the settlement; rather the so-called victory to either side is not a victory in the real sense, but an accumulation of revengeful feelings and longing for the time when the defeated may become the victor. Consequently the reliance on force produces no finality. So it can be said of industrial conflict; a resignation to the idea of strike or lock-out produces the same conditions; we may have among all sections individuals pursuing their ambitions by playing upon patriotic or prejudiced feelings and the baser side of our natures, yet who with a claim to a proper conception of the line of true progress resign themselves to the cultivation of force in these matters as being the wisest and most humane course to follow?

In the light of industrial history, coupled with my experience of modern relations between employers and employed, in spite of holding strong pacifist views, force of circumstances have resigned me to support that unfortunate weapon of the strike as a medium for assisting in adjusting differences in the building industry. What is more, absolute unanimity obtains in the operatives' ranks as to this policy. It is to be regretted this is so, but I will endeavour to prove that this spirit is the logical sequence of events.

At the time of writing the atmosphere is pregnant with mistrust and militancy which present an unenviable task to those entrusted to secure a settlement. But a settlement must be arrived at sooner or later, and it behoves all to consider the situation with a desire to come to terms and by pen or speech to do nothing to jeopardise the achievement of this object. Consequently, I claim the indulgence of the readers of *The Builder* to receive any statements I make, however unpalatable they may be, as being conceived with the desire to put what I consider to be the operatives' view in the hope of assisting rather than retarding a settlement.

We are living in an age of stunts; there is a tendency to influence public opinion by using stock phrases when it suits. I note in the ranks of the builders they have one or two experts in this practice: "The unions are breaking agreements," they say; "The unions are unduly interfering with managerial functions." These are stock charges alleged against us. With all due deference to those affected, I claim this is the policy of those responsible for the conduct of the employers' affairs.

My memory goes back to innumerable conferences held between the years 1917 to 1920, when the employers said the operatives should never go back to 1914 conditions. "We pledge our word," they said, "that if bad trade comes we will not use our economic power to depress wages or conditions." At the merest signs of bad trade appearing, however, they commenced to press for reduction of wages, and in this policy strained the letter of our agreements. The fictitious wages which were the outcome of the war we knew had to be adjusted, but six reductions of wages occurred, only two of which were due to variations in the cost of living. The others made a deep inroad into the standard of life of the worker. Take a labourer in London. His possible earnings per week are £2 15s.; deduct insurance, holidays, time lost through inclement weather, and casual nature of his work, at a very liberal estimate the actual earnings cannot be more than £2 8s. per week. Is this adequate? On the question of hours, overtime, and general conditions, in our opinion the employer did not carry out his promise.

The employers were repeatedly warned that the policy complained of was causing a deep resentment in the minds of the operatives, who were bitter not only against the employer, but also against his officials; he became sullen against any authority whatever. Some of the leaders of the federated builders imagined this condition favoured their side. But what a delusion! When, in the course of my duties, I visited some of those fine buildings in Regent-street and the City and noted the immense amount of money being expended on them while the workers were being paid starvation wages, and mess room and lavatory conditions were not up to those of a savage race, I knew in my most depressed moments that a reaction would set in. We have got it, and at whose door should the onus be laid?

Take the Liverpool position. Originally, employers and operatives in that town contracted out of the national agreement; is it to be wondered at, in view of the effects on his fellow-workers in other parts of the operation of the national agreement, that the Liverpool operative sticks to his local conditions, which are a higher standard than elsewhere? Efforts have been made to get him to conform and have regard to the general interest of the industry, but when this meant binding him to a machine which has been less merciful to his fellow-workers in other centres, it was more than human to expect him to respond.

Any machinery such as the Wages and Conditions Council scheme embodies, backed by a short-sighted policy, and lacking some of the more humane spirit that should inspire its working, is bound in its influence as indicated to produce a want of confidence. The lengthy period of negotiations made our representatives appear a laughing-stock in the eyes of their fellow-members, but what did the builders care? They pursued a line of delay which again increased that want of confidence among the operatives.

It is said that by ignoring the employers' claim for a 46½-hour week we broke the agreement. I know this view is held in many responsible quarters, but in London we claim that on account of the attitude taken up by employers we are right in standing by the 44-hour week. In the first place, let us examine the Fraser award. During the inquiry over which Sir Hugh Fraser presided, the employers put in evidence showing certain parts of the country did not honour the 44-hour week; on the other hand, we submitted evidence showing that some parts did honour it, and London was included in the latter. The Fraser award on hours was, in our opinion, founded on this divergence in evidence—hence the proviso which stipulated that the 44-hour week could be perpetuated by mutual consent. Subsequent events again demonstrated the mind of the employers, who issued a circular advising their local associations to oppose a 44-hour week. In London we anticipated a conference to discuss the situation, but when we met the employers it was to be practically informed the L.M.B.A. had decided to institute a 46½-hour week, and this meant the final word had been said. We came to the conclusion that if this kind of attitude was to prevail then the whole basis of relations between employers' and operatives' associations had gone. Consequently, on the question of hours, I contended, and still contend, we no more broke the agreement than the L.M.B.A.

It is not true that we have broken the agreement on overtime. All we have insisted upon is to have an equal right with employers to interpret cases of urgency so far as overtime was concerned. Is it to be understood that if we differ from them we break an agreement? Is an agreement only valid when we go into the council chamber and say "yea" to all the employers desire? If so, where is mutuality? It is not true to state we opposed reasonable grounds for overtime. masonry: for at least a quarter of a centu case for overtime has been well establish acted upon, and only within the last y two just one or two employers have t break through this well defined positio

The fear of the unions is that in conse of the time limits on contracts, due building owner and others wanting to co the building as quickly as possible, the w of the overtime rule under modern con would legalise systematic overtime. The much higher output in masonry to-day say, 20 years ago; but also the mason is much harder. Why, then, should called upon to work longer hours? I lea question of the fear of unemployment, is a factor contributing to his opposit overtime.

I am conscious of the need of all o avoid becoming entangled in our prej and thus ignore changes which reflect situation and require reasonable handlin account of certain phases, we suggested conference with architects, builders, an selves, to consider this question of con The builders agreed one day, but later on pooched the idea. Why?

The more overtime permits were gran more the applicants increased. The ope had ground for fear. Overtime is cost moralising, and tends to undermine effi it also tends to keep wages low and s long hours. For years we contested w employers who were wedded to the overtime. They gave way eventuall most old-established builders will ad were right. I do not agree with takin negative position on every occasion, have a right to examine and determi policy on these matters equally wi ployers, and it is time this cry of b agreements should stop.

Let us trust that before long, in spit differences, more reasonable counsels v vail. It is not for me to say upon wha the final settlement of the dispute w It is safe to say at least 60 per cent operatives are working for higher wag offered by the Wages and Conditions and where 46½ hours obtained prior to the hours being worked elsewhere are 4 and payment for loss of time through ir weather is recognised. The builders face these facts and try to settle on t of same. I feel no settlement is of unless the rank and file of the operati the final voice on the matter. We revive their confidence: this will pr cheapest in the end.

I cannot conclude this article witho ence to the suggestion by Mr. W. H. K.C., in your issue of July 25, on the of whether the Joint Industrial Counci Building Trades can be revived. Th good deal to be said for it; in fact, ov ing reasons can be advanced in fav with your permission I would like to this in the next issue of *The Builder*.

Victoria and Albert Museum.

The Victoria and Albert Museum has two pieces of English furniture from t tion of the late Colonel H. H. Mulline consist of a small commode of serpenti enclosed with folding doors, veneered w wood and rosewood, and decorated wit and trophies of musical instruments other woods. The angles are fitted wi modelled mounts of gilt metal. Thi furniture was made by Chippendale English cabinet-makers about the y and follows to a certain extent the Fr of Louis XV. The second object i dressing-table from the same per veneered with panels of satinwood and i classical vases, festoons, foliage, &c., i various colours. The lids of the dr inlaid with heads of a man and Eastern costume. The feet are m brass, chased and gilt.

E BUILDING TRADE NEGOTIATIONS

e suggestion of the Minister of Labour, oned in our last issue, a prolonged e took place on Monday between atives of the national organisations ilding trades employers and operatives, was arranged that the Minister of hould invite the same organisations he Liverpool employers and operatives er conference to be held as soon as The following official statement was fter the meeting:—

esentatives of the building trades s and operatives met at the Ministry r this afternoon, under the chairman- ir David Shackleton. After a gen ral n of the position, it was agreed that stry, acting upon the conclusions of t of Inquiry, should invite representa- he national organisations of employers, with representatives of the Liverpool s and operatives, to a conference."

roposal of a conference was agreed to le at an early stage of the discussions, is stated, difficulty was experienced a form of words acceptable to the two he employers were of opinion that the t of the difficulty at Liverpool must edence of the consideration of the other n dispute. Mr. George Hicks, on the s' side, expressed the opinion that the difficulty was insoluble by the national

Barron, on behalf of the operatives, that "independent of a settlement rerpool difficulties, a conference of the representatives of employers and s be convened at a convenient date. readjustment of wages, the 44-hour d general conditions of employment be d with a view to trying to effect a t of the present national dispute." loyers would not agree to this, but that the Liverpool situation must lealt with.

nference broke up at this point. One eratives' representatives, it is stated, an employer as "a slippery eel," od deal of heat developed. The em- eft the conference as a protest against essions used on the other side of the he decision announced in the official had, however, already been taken. Ministry proceeded to issue invitations conference.

TRADE NEWS

Housing in Paris.

A law has been passed in France prohibiting the transformation of unfurnished apartments into furnished apartments. It is stated that in Paris alone 50,000 holdings, ranging from single rooms to self-contained flats, have been transformed into furnished rooms or furnished flats, while over 2,000 buildings formerly let to tenants possessing their own furniture have been changed into furnished residential hotels.

Eastwoods, Ltd.

The Directors of Messrs. Eastwoods, Ltd., have declared a dividend of 7½ per cent. (less Income Tax) for the year ended March 31. They state the demand for the Company's products is not only maintained, but the whole output of the various works for a considerable time to come is covered by orders in hand, while the sales of general merchants' materials continue to increase, and it is confidently expected that the results of the current year's trading will be even more satisfactory.

London Town Planning Scheme.

A town-planning scheme for South-East London has been approved by the London County Council. A special committee reported that the area of 7,150 acres was situate within the boroughs of Woolwich, Greenwich, and Lewisham, and contained the largest and most compact portion of the undeveloped land in the County of London. Approximately it is bounded by the Shooter's Hill-road on the north and the Bellingham estate and Bromley-road on the south-west. Consent to the scheme must be given by the Minister of Health.—The Housing Committee proposes to spend £300,000 on the purchase of two sites in the Hendon district. One site, known as Burnt Oak, consists of about 223 acres on the west of the Edgware-road, and the other, called Red Hill Farm, consists of 230 acres on the east side of the same road.

PROPOSED NEW BUILDINGS & OTHER WORKS

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations: T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; B.C. for Borough Council; P.C. for Parish Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; and B.E. for Board of Education.

K.—BUNGALOWS.—The Upper Renfrewtrict Committee has passed plans for ngalows on a new road off the Grove dvale-avenue, Giffnock, South, for the uilding and Investment Co., Ltd., 30, uare, Glasgow; 31 terrace houses on off the Busby-road, Giffnock Building Co.; bungalow at the corner of Milverand Torrington-avenue, Giffnock, South, . M'Neill Brown, Dumbreck, Glasgow.

NEW BUILDINGS IN SCOTLAND

Annan.—HOUSES.—The T.C. will obtain tenders for the various works in connection with the building of six more houses at Millpark.

Bo'ness.—SCHOOL.—The Linlithgowshire Education Authority has decided to erect a central advanced school at Bo'ness.

Bonnyrigg.—HOUSES.—At the last meeting of the T.C. the Burgh Surveyor reported that plans had been submitted for the erection of 14 houses by private enterprise.

Cardonald.—HALL, &C.—The Upper Renfrewshire District Committee has passed plans for a church hall and annexes at Cockerhill-road, Cardonald, for the Episcopal Church.

Dumbarton.—ALTERATIONS.—Plans have been prepared by Mr. W. A. Macartney, in consultation with the Chief Architect to the Ancient Monuments Board of Scotland, for the restoration of Glencairn House and its adaptation for Council offices. The estimated cost of the work is £4,000.

Kirkintillock.—HOUSES.—The T.C. proposes to erect 100 houses.

Largs.—ALTERATIONS, &C.—Mr. Robert Barr has presented the mansion house and grounds of "Mansfield" to the town for recreation purposes, and has offered to co-operate with the T.C. in the erection of a pavilion in the playing fields.

Scoonie.—CEMETERY.—The Scoonie (Fifeshire) P.C. has approved plans for laying-out an extension of the cemetery.

CONTRACTS, &c., OPEN.

AUGUST 11. — **Renfrewshire.** — ROADS. — Widening the western section of Paisley-road, extending from Lennox-road to the boundary of the Burgh of Paisley, for the Upper District Committee. Messrs. Formans & M'Call, civil engineers, 160, Hope-street, Glasgow.

AUGUST 11. — **Renfrewshire.** — ROADS. — Widening the eastern section of Paisley, extending from the boundary of the City of Glasgow at Half-way to Lennox-road, for the District Committee. Particulars from Mr. James A. McCallum, District Clerk, 15, West George-street, Glasgow.

LDING TRADE WAGES IN SCOTLAND.*

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

VII.—No. 4253. AUGUST 8, 1924.

ON LOOKING AHEAD

EVERY age, we suppose, has its cut-and-dried opinions upon certain measures requiring legislation. If we happen to be dealing with a social problem, it matters not at all that we should have hazy ideas upon its relation to other social problems. Definite values of and wrong are assumed, and constructive criticism is ted as adverse criticism.

e created a housing shortage (we have ceased to speculate the wisdom of this action), and we must build. This is ide of the problem, but there is also another. Having ed a housing shortage, costs of materials and wages are , as we would expect. The remedy of the popular press threat of Government control similar to that during the -a threat which is almost ludicrous to those with memories previous control under which even a fool could prosper. natural and simple remedy of the layman is to refuse to until prices come down, but he is thereby increasing the ng shortage, and like Pooh-bah, he must compel himself ild—as an official. In this way he defeats his own object, on and on the vicious circle keeps increasing. We can he social and economic aspects in this way: we need s; we refuse (as individuals) to build at the price, yet we uild. We can think of no compact little quotation or rb, with an agreeable flavour of antiquity, to suit this ion; if we could, it is quite conceivable that it would be l with all the authority of a proverb and be accepted as asant way of clinching what threatens to be an endless ssion. The agreeable method to get over this absurd muddle be to forget about it, in the hope that things would right elves, whereas, on the contrary, our politicians are con- ating a running fight for many years ahead.

Unless some remedy is forthcoming, either through the ional methods of building or by a modification of our iose schemes, the nation inevitably must pay a heavy

On the simple issue of ways and means we believe that a mistaken policy to do more than legislate for a short l. There are scores of sentimental reasons for building houses, but against these there are scores of practical ns against the principle of Government housing schemes a long period. Unfortunately, the nation will not yet t what appears at first sight to be an anomaly: that one be an enthusiastic housing reformer, yet not be able to about either the method or the extent of our housing . It is useless for us to argue that the real significance problem of better houses only emerges when the artificial r of subsidies becomes no longer necessary.

ppose, however, we assume that the financial side pre- l no difficulties, we have still to examine some aspects of uge housing programme which we are planning for ity. In assuming this, we are aware we lay ourselves o the retort that there is a fairly general belief that under conditions there would either be no housing problem, or, st, it would have no interest for our politicians. Never- s, we would like for the moment to distinguish between using shortage and housing ideals; between how to houses and our ideas for posterity.

few weeks ago we expressed the opinion that we doubted er any party has explored the problem thoroughly. ding the design of houses, and estate development, we he Tudor Walters report (in our opinion one of the most and suggestive publications yet produced), but we have see what a committee of non-party professional and ss men of experience would submit upon the general ples underlying the idea of better housing. We have umber of intellectuals who think they know what the an either wants or ought to want, and he is the one man all who ought to be represented on a commission. We like to ask the following questions:—

Has any one visualised the result or effect of building ns of houses at, say, 12 to the acre?

We know that a twopenny tram fare, in certain districts, has put the new houses beyond the reach of the workman. But suppose we remodel our whole transport system, and reduce the cost of travel to next to nothing, and making all allowances for the acceleration in speed of travel, is it certain that the workman can afford the necessary time before and after his working hours?

(3) Is there convincing evidence to prove that many of the workers do not prefer to be housed in high-class tenement blocks in the city near to their work? We may not think they ought to be in the city, but we know that many wealthy people prefer to live in the city, and that everyone is not an amateur gardener despite the theories of the idealist. If there is a doubt on this matter, we may find in the end that we have still to build "workmen's dwellings."

(4) Is it realised that while we are ostensibly building houses for "workers," we are also building houses for the "lower middle classes"? Incidentally, this may explain the complaint that workmen's dwellings are a little too small for the occupiers.

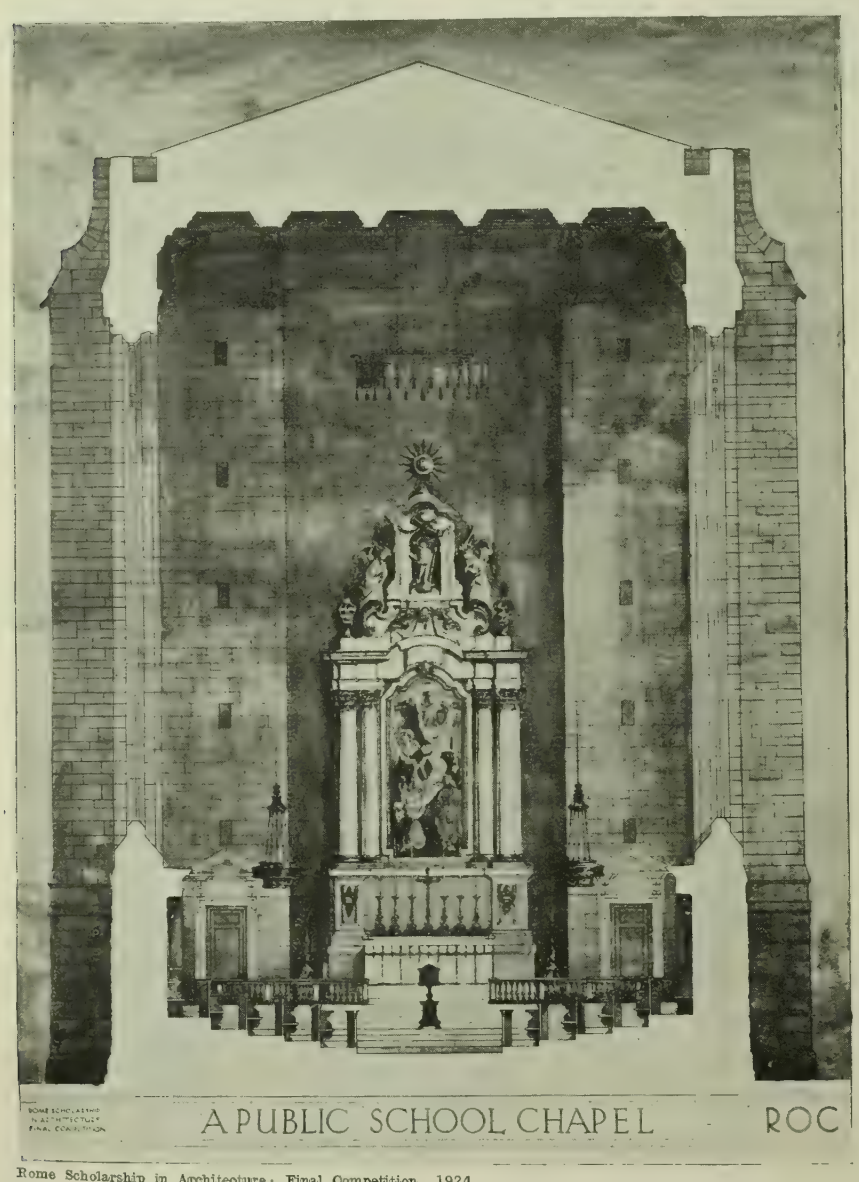
(5) Assuming we have found the ideal housing scheme in all its details, have we taken any steps to see that the individual (regardless of his social position) can secure these benefits through legislation? In other words, have we not made a distinction between the individual who can afford to build a house, and one who cannot pay a rent?

(6) We are legislating for houses for many years ahead. Assuming that building costs and rentals reach an economic level: what then?

(7) Are we making any allowance in our housing programme for new inventions which might alter the whole conception of house construction? (This observation applies also to the financial aspect.)

(8) We look for a report to prove conclusively that better housing is either an ideal which requires subsidising permanently, or that it can be a practical and economic solution requiring no help from subsidies when building conditions have ceased to be artificial. The housing shortage and subsidies are intimately connected, we know, but the public does not understand the relationship between housing ideals and subsidies. If these matters were carefully examined, it is probable that housing legislation would be simplified, and the outlook altered.

In submitting these points, we ought to say that we consider the Government housing schemes to be a great advance both in the design of the small house and its amenities. They have met the needs of a number of people, and when we say that many of the architects who have designed these houses are now occupying them we have stated both the need for the privileges to be extended, and for an examination of the problem of "workmen's dwellings." We merely question whether we have found either the solution we are seeking, or the ultimate solution.



We cannot estimate what any particular Government will do; all that we can ask is that it should be guided by the report of a Commission so that it may secure the true ends which are essential to the ideals of housing. The actual number of houses which any Government may care to subsidise is another matter, and has no significance in our observations.

We do not think that future generations are likely to suffer from the housing schemes which our politicians are now so anxious to settle upon them; they are more likely to suffer from our conception of housing ideals—a totally different matter from the supplying of houses. It is hardly just to say that the housing shortage has become an obsession, but it is fairly certain that long before our housing schemes have run their course there will be many alterations—if our housing Acts are not obsolete. A housing shortage and housing ideals may appear to coincide, because they present the opportunity, but they demand separate legislation. Meantime (apart from our housing schemes) what have we done to secure for everyone the elementary factors which lie at the root of good housing conditions?

NOTES

The Architectural Education Conference. If the Conference on Architectural Education which was organised by the Royal Institute of British Architects has not provided any very striking or original ideas, it has been a highly important and successful meeting. Many subjects of considerable interest have been discussed, as will be realised from the lengthy reports we have published; but the importance of the Conference will not be fully realised until the proceedings are before us in full and we have a translation of the foreign speeches as well as papers, when we hope to discuss some of the questions considered by the Conference.

River Traffic. There is talk once more of attempting to ease the traffic congestion by utilising the river. It appears extraordinary to the Frenchman, who is accustomed to the Seine, that the Thames plays no part in coping with London's traffic. We are aware of the tidal difficulties and of the changed conditions that have existed since the removal of old London Bridge, but it surely cannot be beyond our power to restore the river to its former position as one of our main arteries. One would like to see a time-table worked out, with allowance for the tides, and we are convinced that many business and professional men who live in areas adjacent to the river would welcome an adequate service of steamers to take them to and from their daily work, so that they could escape being jammed into trains or scrambling for the omnibus. A little longer on the journey, entailing an earlier start, would be a slight inconvenience compared with the advantage obtained, especially in fine weather. Besides, what better route could there be for such short journeys as Cannon-street–Westminster, or Charing Cross–London Bridge?

Rome Scholarship in Architecture: Final Competition, 1924.

Jarvis Studentship: Accepted Design. By Mr. M. A. Sisson (London University School of Architecture.)

The Victorian Bedroom Even Mr. Lytton Strach must admit that the action is coming. T generation has made sp of its predecessor, but the next discover its grandmother. It will, course, begin with Early Victoria; alre the 1840–1850 house and London squ are justly recognised for their qualiti certain mahogany and walnut furnit has a lightness and strength that m it welcome in any room, and the bea screens and footstools of the period snatched at in the sale room. But Ea Victoria was separated by the best of a generation from Mid; what is collector to anticipate in Mid-Victor It takes courage to envisage the arra impossibilities, and it would take a l to stow away the portly sideboa dinner wagons, and mighty dining-r chairs. What of the imported E cabinets and the elaborate overmant We do not think that their hour is hand, but if we had the space to h it, we should begin to collect good l room furniture. The cabinet work f 1850 to 1880 is admittedly heavy, but fine graining and fine timber it has n been surpassed. The wardrobes, dres tables, and washstands (even if mar topped) have a quality that must c mand respect, though to those of us are wedded to earlier work affection still be lacking. Admittedly much we have mentioned is too cumbrous the small modern house, but it is t hoped that those occupying large, fashioned homes will wait for the re of what is essentially a Period in En cabinet work.

St. Bartholomew's Hospital. Our readers are prob aware that last April Paul Waterhouse was pointed Honorary Con ing Architect to St. Bartholon Hospital, and it seems necessary explain that this appointment does imply either that the Governors of Hospital are generally in favou endeavouring to obtain architec advice free, or that Mr. Waterh considers that hospital architecture sh go unpaid. As a matter of fact explanation is a simple one. Mr. W house was invited earlier in the ye advise as a paid consultant. He sidered, however, that the natur certain advice which he had previ given in the capacity of President c Royal Institute of British Archi together with certain consideratio relation to other architects, would r a paid appointment liable to misu standing and possibly to embarrass He, therefore, accepted the suggesti the Hospital Board that he should them as a Governor and under the of Honorary Consulting Architect part in the Board's consideration c work in which professional architec advisers may in due course be engag

rbohm ee and illiam urges.

A NEW story in "Studio and Stage" about Tree recalls a similar incident in which Burges was the chief character. According he Tree story, the famous actor- ger, having expressed himself speci- delighted with a piece of scenery ed for one of his notable successes His Majesty's," happened to hear casual suggestions thrown out by ng lady, proposing some inconse- ial changes which, however, would spoiled the scheme considerably. ainter, Joseph Harker, says he was y surprised to hear Tree immedi- agree, and the more so when, in ost engaging manner, he asked his to have these alterations made, hen, without waiting for any com- , hastily left the theatre. It was nt that discussion would not avail, e stage hand was ordered by Harker t the piece in question out of sight, in the dock, where it remained ched till the whole scene had to be n. Tree had, in the meantime, several inquiries about it, and was ed all was "well in hand." Any- the result caused Tree to exclaim on the completed stage effect, "Ex- t—heaps better than it was!" m Burges, it will be remembered, ned the famous stalls for Worcester ge Chapel, Oxford. This work in- s a series of excellent carvings of t animal forms conceived in the of the Middle Ages. A. Robinson, ell-known Gothic craftsman, carried he job. Burges called at his shop, Drury-lane, to see these stalls prior eir dispatch to Oxford. He found faults, worked himself into a bad r, and left Robinson much upset s fury. Nothing could be done to ve or change the condemned stalls, ey were put back waiting events. weeks later the architect called to a further inspection. Burges ex- d himself well pleased, and his had changed though the carvings ned unaltered. We are reminded Irving was all amiability when ssed, say, in the character of the r of Wakefield," but when engaged rôle of "Mephistopheles" was be "deuced unpleasant," putting in a stew. Tree and Burges also heir moods evidently.

venir lace of ts.

THE illustrated souvenir of the Palace of Arts at the British Empire Exhibition, which we have received, is interesting record of the art of the e at large, and also of the art of the the retrospective Loan Collection paintings, including several very ntative examples. It was desired, are told in the Introduction, to the relation of United Kingdom gs to those in the Overseas es and so to present the widely-

THE ADMIRABLE DECORATIVE EFFECTS OF PANELS IN THE HEADSTONES OF OUR CHURCHYARDS IS SUGGESTED ABOVE.

divergent impulses which influence the art of the Dominions. The collection is certainly very wide and varied, which is, perhaps, as much a weakness as a source of strength, but it enables us to form a view of the impulses moving through the arts at the present day. The illustrations include various examples of handicraft, and there is a small collection illustrative of the art of the theatre. Of the example of sculpture illustrated, the fountain figure and Laughing Girl, by Phœbe Stabler, have all her characteristic charm and vitality, and are fine examples of an art which seldom reaches in this country the highest distinction. Ecclesiastical art also forms the subject of illustrations which are of varied merit, lacking on the whole the atmosphere which would establish the reality of its impulse to affect us very much. But perhaps out of its real ecclesiastical setting this must be the case, and it is a question whether the art is furthered much or at all by this sort of publicity. The Souvenir is well printed and is an agreeable record of a remarkable collection of the art of our own time.

Roadside Trees.

WE are glad to see that the Director of the Royal Botanical Gardens at Kew, Dr. Arthur Hill, has drawn attention to our lack of imagination in tree planting. Wherever we go we see the horse chestnut, the plane, elm and lime, when we might enjoy an immense variety of smaller growing and other flowering trees—the flowering ash, silver birch, Norway maple, red oak and the tree of Heaven. The tulip and the maiden-hair tree are further suggestions. Few people are aware that the fan palm (*Chamerops Fortunei*) is perfectly hardy in England, and large specimens can be seen in Kew Gardens. Why not compete with Continental towns and provide a few avenues of these in our streets?

Lamp Post Signs.

WE note that the Lambeth Borough Council has again refused to allow its lamp posts to be used for purposes of advertisement. The lamp posts should undoubtedly be reserved for official notices. We can imagine how much confusion would be added to the streets if we were faced with an array of lamp advertisements mixed with official directions as to 'bus stops, fire, and ambulance notices, and the like. We sincerely trust that the advertising convention recently held will have stirred the advertising authorities to take active steps towards curbing the excess of zeal that too often lowers what should be a great and noble business into an instrument of offence to the public.

The Building Trade Dispute.

IT is some satisfaction to be able to state not only that a round-table conference has been convened by the Minister of Labour to continue discussions with a view to reaching a settlement of the building trades dispute and that the conference took place on Wednesday, but that the Liverpool men, who have repudiated the authority of the unions to which they belong, have accepted the invitation of the Minister of Labour to send representatives to the conference. On behalf of the national employers, the statement has been made that "when the Liverpool problem has been disposed of, there will be no issue which is not capable of negotiation," and as this was the opinion of Lord Buckmaster at the Court of Inquiry recently held we may hope for a speedy settlement of the dispute. The Disputes Committees of both the Employers' and Operatives' organisations met before the meeting on Wednesday to decide the policy to be pursued, but at the time of going to press no settlement had been announced.

GENERAL NEWS

Professional Announcement.

Professor Derwent Wood, R.A., has resigned the chair of sculpture at the Royal College of Art, South Kensington.

Architects' Estates.

Mr. George Haywood Truefitt, of Hornsey-lane, Highgate, N., and of Warnford Court, Throgmorton-street, E.C., formerly of Fern Bank, Tufnell Park, N., architect (net personalty £12,764), £13,439.

Brevet-Colonel Cecil Locke Wilson (50), of Garnhill, St. Andrews, Dinas Powis, Glamorgan, architect (net personalty £7,567), £9,090.

Welsh Hospital Extension.

Lord Tredegar, at Newport, Mon., recently, opened the new wing of the Royal Gwent Hospital, erected at a cost of £60,000, and part of an extension scheme which will cost £240,000.

English Furniture.*

This is a valuable little volume containing no less than 56 beautifully printed half-tone illustrations, with comprehensive descriptions of the various pieces. In a portion of his preface Sir Cecil H. Smith says, "It is not the policy of the Museum to encourage the removal of treasures from churches or other public buildings, but to rescue and preserve such as have lost their proper homes, so far as our limited financial resources make it possible"; surely a very admirable policy, deserving every support. The illustrations cannot be passed without a few words taken at random. Plate No. 4, "Three posts from the altar screen, Chichester Cathedral, about 1530." The beauty of design, their proportion, the execution of the carving, are wonderful. Plate 19, "Upper part of a stall end, from a Norwich church, 15th century, and upper part of a stall end from Norwich Cathedral," is another spirited piece of carving. The numerous chests, forms, and other articles illustrated are worthy of study by the student, collector, and lover of beautiful craftsmanship. Other volumes are to follow the present one, Late Tudor and Early Stuart (A.D. 1550--1660), Late Stuart to Queen Anne (A.D. 1660-1714), Georgian (A.D. 1715-1830).

* *Catalogue of English Furniture and Woodwork.* Victoria and Albert Museum (Department of Woodwork). By H. CLIFFORD SMITH, M.A., F.S.A. Vol. I, Gothic and Early Tudor. Price 2s. 6d.; by post, 2s. 10½d.

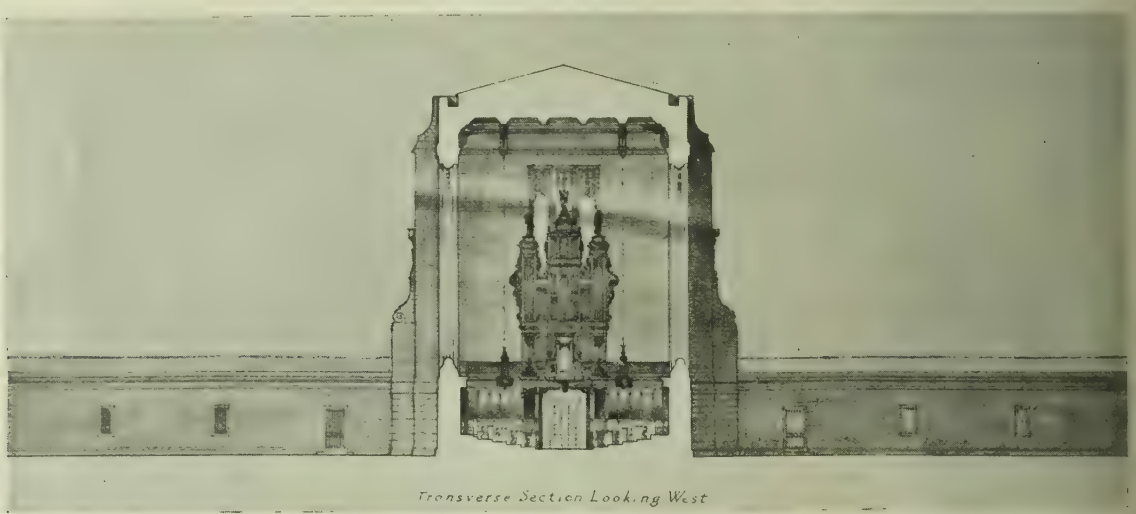
Builders' Estates.

Mr. Joseph Isaac Hallam, of Kitchener-road, Leicester, builder (net personalty, £57,418) —£85,496.

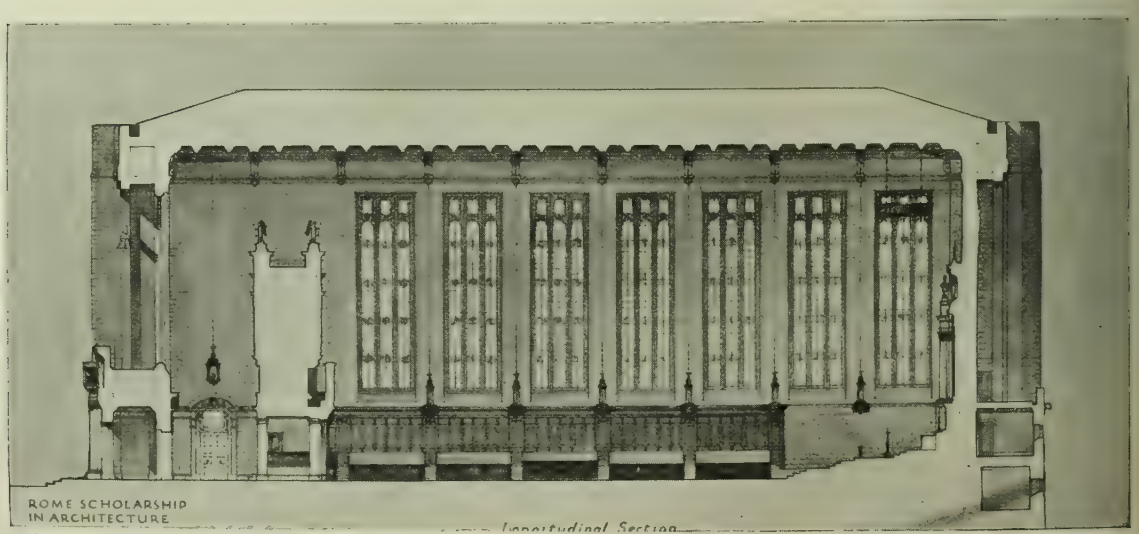
Mr. William Mailer, Jordanhill, Glasgow, slater, plasterer and tile roof contractor, £12,525.

COMPETITION NEWS

Rome Scholarship in Architecture.



The scholarship in architecture offered by the British School at Rome was not awarded this year. The Jarvis Studentship (given by the R.I.B.A.), £250 per annum for two years was awarded to Mr. M. A. Sisson, B.A. University of London, and is given in this issue. The design of Miss Elsie Rogers was placed second.



London Hotel.

Designs for a row of shops, with an hotel over. Premiums of £150 are offered for the selected designs. Particulars from Mr. H. Waldu Imperial Hotel, Russell-square, W.C. 1.

Other Competitions.

Other competitions still open include the following (the dates given are, first the sending in date, and second the issue of *The Builder* which full particulars were given):—Ross-Sm Memorial (Sept. 30; Feb. 21). Harrogate Infirmary (Sept. 30; May 30). Hamilton W Memorial (Sept. 1; May 30). Glasgow H School Memorial (Sept. 30; June 13). Maso Memorial (Aug. 22; June 13). Bexhill Ent tainment Hall—Banned by R.I.B.A. (Sept. May 30).

Rome Scholarship in Architecture: Final Competition, 1924.

Design for a School Chapel.

Jarvis Studentship: Selected Design. By MR. M. A. SISSON (University of London School of Architecture.

CONSTRUCTIONAL ASPECTS OF THE LIVERPOOL CATHEDRAL

By J. E. MARSHALL, B.Arch.

Senior Lecturer in Architectural Construction in the University of Liverpool.

The visitor to the new Cathedral will, as approaches, see at once that Sir G. G. ott has made effective use of compara-ely large plain wall surfaces and heavy sonry masses. Larger windows and less l area came as a natural corollary to in-ased facilities for the manufacture of ss during the fourteenth and fifteenth turies. This reduction of wall area and increase of thrust from the vaulting ant larger buttresses. Here in our new hedral Sir G. G. Scott makes use of ple buttresses and wall area as though paring the building to withstand the ele-nts for all time in its elevated and ex-ed position. The plan is, in the main, nmetrical, and its expression in the erstructure will result event ally in a uping reminiscent of the classic tradi-n.

To these simple facts probably more than ny other is due the feeling of repose and fulness which the building pre-eminently es—in contrast to the disturbing quality is so often to be found in authentic mples of Gothic architecture. The form he design is distinctive and modern: its erful masses and its detailed mouldings e a boldness and vitality of a new order. n this stupendous undertaking many in-sting structural problems have inevit-arisen. The present article is written nly to draw attention to some of the blems which were met with, some of ch have been solved by the men on the , under the direction of the clerk of rks, Mr. Pittaway, who is to be con-ulated upon the care, skill and resource nas shown in his great task. There is ost the same absence of finality in the blems involved in this class of work as e is in the style of architecture, which me mysterious way fits it for the archi-ural expression of religious ideas.

he main structural features are in them-es almost bewildering. The great but-es projecting some 30 ft., at the base, n the main walls are required to take hrust of the vaulting of the choir. But-es of such dimensions would appear to nnecessary if thrust from the vaulting alone to be considered, especially when nd that, in effect, they do not terminate he main wall. Anyone paying a visit he first time would not realise, until nters, that there are aisles about 13 ft. idth flanking the choir; and further-, that the vaulted ceiling delivers its st upon the inner piers. On further ination, however, it is seen that these are really part of an extension of the esses. That is to say, the buttresses continued, or arched at certain points s the aisle-space and terminate in the . This renders the buttresses still substantial, and it is probable that the projecting buttresses will receive only ght amount of lateral thrust from the ing. Such an arrangement has much mmend it, for here we have solidity firmness, convincing qualities which usually characterise the classic rather than the Gothic mode of building.

Owing to the nature of the subsoil and having regard to the immense concentrated loads from the superstructure, the foundations were taken down a considerable depth (varying up to 54 ft.), until the solid hard rock was reached. The excavations, when made, were filled up to the ground level with either Portland cement concrete or hard blue bricks. Countless stones now rise one upon the other, forming the massive piers which rise to a great height until they appear to lose themselves in a bluish haze.

Here is the vaulting, simple yet complex in its construction, where problems have arisen which must have taxed the most skilled. The vaulting over the choir has a span of about 47 ft., and is formed into a pair of quadripartite vaults to each bay. From a respond over the apex of each main arch spring the intermediate ribs. The main vault, on a magnificent scale, begins to spring above the lofty arcade, and in place of a clerestory is a blind gallery separately vaulted. A fine effect is given to the delicate breasting spanning the dark gallery by the light which enters the choir in each bay by a single large window in the main wall behind the arcade.

The main ribs of the vaulting are 3 ft. deep by 1 ft. 4 in. thick. The filling consists of courses of long stones, each course forming an arch from rib to rib in the French manner. Thus the vault is more or less domical in form, a feature which gives strength and stability to the whole fabric.

Some of the most difficult problems in masonry are those relating to vaulting, the perfect execution of which, from the knowledge required of projection and of the intersection of curved surfaces, has always been the severest test to which the skill of the mason can be exposed. Mouldings on diagonal ribs vary in profile on the same side of the rib, and the variation is not equal on both sides. The mouldings must follow, to some extent, the peculiar twisting surfaces of the vaulting. So much do these vary in each groin or rib, as well as in the individual ribs which ascend in the vault to meet at a central point, that in order to hide these discrepancies, or at least to make a fair junction possible at the crown, an ornamental boss becomes a real necessity.

A finely executed piece of work is to be seen in the vaulting between the last main arch of the choir and the arch of the east window, which is higher than the former by about 2 ft. This difference in the level of the two arches is a device adopted in order to correct an apparent drop in the height of the east window when viewed by the spectator from below. The surfaces of the stone filling are here twisted into very complex forms. This can best be seen from the blind gallery previously referred to.

We come now to the most ingenious and probably the most daring piece of construction, namely, the great vault over the first bay of the central space. It is impossible to comprehend its magnitude from below. One must view it from above the vault itself to be able to grasp its true dimensions, and the best position is directly over the large central boss. Looking at the plan it will be seen that the problem is to cover the crossing between the future tower and the choir from four points of support on one side, and two on the other; and at the same time the height has to be raised 3 ft. The space to be covered is approximately 50 ft. by 87 ft. The four main ribs meet at the large central boss, but the ribs on opposite sides are not in the same plane—because of the irregularity of the space covered—and yet two of them form, in effect, one complete arch some 80 ft. or more in span. These main ribs, though large in section (3 ft. 6 in. by 15 in.), appear to be quite small when compared with the large span. The security of the rib or ribs is in their contour, for though they may follow the lines of a pointed arch, they nevertheless approximate a parabolic outline which would give the best results, structurally, in such a case as this. Sir G. G. Scott himself must have had some doubt about the stability of this delicate-looking rib or arch before the smaller ribs and the filling were placed in position. It is doubtful if there exists any structure built in stone quite equal to this. The vaulting rises from its springing about 50 ft., a height much foreshortened when seen from below. The large central boss has an over-all measurement of roughly 6 ft. by 5 ft., and is made up of five stones, including a cylindrical one in the centre to form a key. Most of the smaller bosses are made in one piece, and contain some 40 to 50 cubic ft. of stone in each.

A striking example of the complexity of the vaulting is seen in the first bay of the central space, between the main arch of the choir and the first rib. Part of the face is hidden, so that the horizontal direction of the face is not visible. From the point of springing of the filling, the face begins to twist and continues to do so, horizontally, in its ascent, until about three-quarters of a circle has been traversed, and then returns part of the distance before the surface ends at the crown of the vault.

These examples of elaborate and difficult construction in stone are all the more remarkable because we may be said to have passed the age of masonry craftsmanship for such purposes. For more than half a century, architects have spanned their great spaces by steel and reinforced concrete. Stone has come to be used more and more as a screen or veneer for the protection of a metal or ferro-concrete skeleton. In the Liverpool Cathedral the stone-mason has come into his own again as a great constructive craftsman.

OBITUARY

The death took place recently of Mr. Frank A Brewerton, A.R.I.B.A., a well-known Manchester architect. Mr. Brewerton, who died at the early age of thirty-six, received his architectural education at the Manchester School of Architecture. He took a distinguished part in the war, obtaining the rank of Captain and receiving the Military Cross.

The death took place recently of Mr. Ernest G. Davies, M.S.A., at the age of 53. Mr. Davies was articled to Mr. John Parker, City Surveyor, Hereford, and studied at King's College, London. He commenced practice in 1893 at Hereford. Among his publications were several pamphlets on healthy dwellings. His works included Sellock Suspension Bridge, over Wye; Isolation Hospital, Burghill, Hereford; Leominster Cottage Hospital, and a good deal of restoration work.

THE BRITISH ARCHÆOLOGICAL ASSOCIATION

By the Rev. P. H. DITCHFIELD, M.A., F.S.A., Hon. A.R.I.B.A.

The eighty-first Congress of this venerable society was held this year at Hastings during the first week in July under favourable auspices. An extensive exploration of the county of Sussex and part of Kent was planned and accomplished, and no better centre could have been chosen than the town of Hastings, where excellent accommodation was found at the Albany Hotel. The Association met under distinguished patronage; amongst the patrons was Lord Curzon of Kedleston, who kindly promised to welcome the members at Bodiam Castle, which he had purchased and restored, and to describe it to them, but at the last moment he was prevented from attending owing to Parliamentary duties. Amongst the other patrons were the Marquess Camden, the Earl of Chichester, Lord Leconfield (Lord-Lieutenant of Sussex), Lord Eustace Percy (M.P. for Hastings), Lord Ritchie of Dundee, the Bishop of Chichester, and others in the county. The reception committee included the Mayor of Hastings, the Archdeacon of Hastings, the Dean of Battle, and others.

The Association was very fortunate to have again as its Congress President, Mr. Charles E. Keyser, F.S.A., who has acted in that capacity for seventeen years, and also two indefatigable organising secretaries, Mr. Philip M. Johnston, F.S.A., and Mr. John E. Ray, whose knowledge of the antiquities of Sussex is unrivalled. Mr. Bagster-Collins acted as secretary and his grandfather as treasurer. About sixty members were present at the Congress, including the Editor of the Journal of the Association, Mr. Harold Sands, F.S.A., Mr. Webb, Mr. and Miss Reginald Taylor, F.S.A., Mr. W. Dale, F.S.A., Mr. A. Radford, and many others.

The proceedings began after luncheon at the Albany Hotel with an exploration of the antiquities of Hastings under the guidance of the organising secretaries. By permission of the Earl of Chichester, Hastings Castle was first visited and described by Mr. Ray. And here I may refer to an earlier visit of the Association to Hastings nearly sixty years ago which called forth an excellent work by the late Mr. Thomas Holwell Cole on the "Antiquities of Hastings." He tells how cruelly the sea has dealt with the town, washing away the Old Burg. Archæologists have gained much knowledge since that writer's day. He claims a British, Roman, and Saxon origin for the town; but modern antiquarians are more cautious; and whereas Mr. Cole said on Castle Hill there once stood a Saxon fortress, Mr. Ray states that there is no evidence of this, at least, so far as masonry is concerned. He stated that the first castle erected on that site was built by William the Conqueror, who landed near Pevensey and then marched on Hastings, where he raised a typical Norman temporary castle of timber, erected on a mound with a stockade around it. Such a castle is faithfully depicted in the Bayeaux tapestry. This was brought over ready for raising from Normandy, and was put together in the west side of Castle Hill during the ten days which intervened between his landing at Pevensey and his march on Senlac, the battlefield so fatal to English hopes. The site of this castle has disappeared, the west side of the hill having been cut away for the building of houses, and the outer ditch of the castle has also vanished and also an advanced barbican.

The Conqueror bestowed the Rape of Hastings on his faithful follower Robert Count d'Eu, who founded within the precincts a collegiate church about the year 1070. He was faithful to William during the troubles of 1088, when Robert, his son, rebelled against him. The curtain wall was built about 1150, the keep between the year 1170-80, followed by the central tower and chancel of the church. The remains of the castle are slight. According to the plan we can trace the eastern entrance and the towers flanking it; the postern tower communicating with a passage in the thickness of the wall; the castle mound and keep; the north gateway and dungeon. Of the church there remain the nave with chancel arch (which we believe to be a reconstruction), chancel, sacristy, vestry, chapter house and deanery, sally port and ruined tower, Norman turret, drawbridge gateway and portcullis, and on the west wall traces of machicolation. The mound was trenched in 1824, but nothing was found.

Mr. Johnston said that Mr. Herbert was the author of the reconstruction of the chancel arch, which consisted of two orders, the inner order resting on a corbel which had stiff-leaved foliage of a very fine and elegant description. He placed the date of it 1170-80. It was of Caen stone, which was so frequently used in Sussex buildings, having been easily brought over from Normandy. The effect of materials on the work in Sussex was very noticeable. Caen stone was easily worked, and excellent results were obtained. He pointed out the remains of a staircase, the supercession of a short choir and the erection of a tower. Herring-bone was observable. The smallness of the building was owing to the cramped site.

The company then adjourned to St. Clement's Caves, which were viewed by invitation of the Mayor. They were known in the eighteenth century, and Mr. Butterfield said they were entirely of geological formation. The caves were purely fresh-water formations, as revealed by the fossil remains of plants and fishes, and were formed when Britain was joined to the Continent and the Weald of Sussex and Kent constituted a delta of a river that flowed here from what is now France. The caves had been cleaned and brushed up some time ago, so that not a vestige of the former contents were to be found. They were rediscovered in 1827, when a new entrance was constructed.

Hastings had two enemies, the sea and the French, who often made raids on the coast of Sussex. The St. Clement's Church belonged to the Abbey of Fécamp, and the earliest building was destroyed by the waves. A new site was granted to the Abbey in 1286 to replace the older edifice. The French attacked Hastings in 1378, and destroyed the church except part of the walls and the lower portion of the tower. A generous citizen, William de Lynda, at the end of the fourteenth cent came forward and built the present chu a good specimen of Perpendicular buildi though it has suffered much at the hands Puritans and "restorers." A restoration made in 1849, and a very drastic one Butterfield in 1874. There were chant founded in the fourteenth and fifteenth c turies, and St. Clement's, the patron saint sailors, was always regarded as a sailo church. The sailors' chantry was founded 1442 and endowed. The tower is curiou situated at the west end of the south ai In the time of Queen Elizabeth the Corpo tion of Hastings gained possession of church, and an order was made that chantries, bells, and other valuables sho be sold in order to provide a harbour. most interesting feature of the church is font, which is very interesting and splen It is of Perpendicular date and octago and sculptured with the implements of Passion: on the west, the Cross and Cr of Thorns; on the north the Scourging P and Scourges; on the east, the Lantern o Pole, Ladder, and St. Peter's Sword; on south, the Reed and Spear crossed; on small shields, Hammer, Pincers and Cr The vaulting of the tower is very charmi showing bosses of foliage. There are piscinæ in the south aisle showing the p tion of the chantries. There are three bras which have lost their effigies, and an inci cross-slab with fleur-de-lis. Beneath the sa tuary is a crypt used as a sacristy. The qu ruple sedilia are reproductions of anci work. The eighteenth-century sedilia are v fine. There are two stoups. Mr. Johns pointed out the niches in the piers next to east end where the rood beam was fixed.

Motor coaches conveyed the party to Ro lands, the house of Major and Mrs. J. Whittaker-Swinton, R.E., who, in their be tiful garden, whence noble views were obtai of the sea and hills and glens, entertai them to tea.

A Norman building once stood on the of All Saints' Church, but only a few tra remain, save the stones built up in the w which reveal Norman axe-tooling, and perh the piscina in the south wall, and the foiled arch cusps. The present building erected (according to Mr. Ray) in 1436. Mr. Johnson declared that there was notl else like it. He pointed out the curious sh of the arches of the nave arcade, which nearly but not quite Tudor. These arches four-centred, and are very rare, especially Perpendicular work. The windows are ne all modern owing to Butterfield's very dra restoration; he swept away many mural pa ings, showing figures of ships connected the representation of St. Christopher. T was an altar dedicated to St. Nicholas,

Lydd.

with St. Clement as the patron saint of
rs, as evinced by the sculptured font at
nton.

ncillor Blackman), who extended a cor-
welcome to the Association. The Presi-
delivered an interesting presidential ad-
s.
n Tuesday, July 1, motor-coaches conveyed
company to Battle Abbey, to the founda-
of which, by William the Conqueror, the
owes its origin. It was the first post-
uest Benedictine house in England, and
ls on the site of the famous battle. The
tiful gatehouse was described by Mr.
ston as a most perfect monastic building.
as erected in 1338, incorporating some
nan fragments. The blind tracery he
ounced authentic. It was built of Sussex
, and Mr. Johnston pointed out the
ish tracery in the arcade of Late Deco-
l work. The string-course was continued
d the octagonal turrets. We noted the
es for images, the windows with wooden
ions, just as they were built, and the de-
ful panel work. On the inner side the
style was evident extending from the
dle Decorated period to the fuller perfec-
of that style. Our guide pointed out the
p cusping, the Kentish tracery which
found in North Oxfordshire and might be
buted to William of Wykeham, the oilet
s, the range of curious grotesques, includ-
figure half woman, half beast, demon,
key's head, lion's head, etc. The front
crowned with battlements with surface
ment, and there is a charming effect of
t and shade. Mr. Johnston told the story
s foundation, which need not be repeated

dicated to the Blessed Virgin, Battle
ch was founded for the servants of the
stery by the monks in 1110, and illus-
s well the growth of a parish church. In
it consisted of a plain Norman nave and chancel with no tower. Forty years later the nave was enlarged and the tower added. In 1180 the arcades and aisles were constructed. French influence is seen in the capitals, which exhibit the palm-leaf decoration. The west end is purely Early English; the windows and clerestory have lancet windows, and the latter are placed over the spandrels rather than in the usual place over the apex of the arches. There were some most interesting mural paintings of the fourteenth century, an account of which was published in Vol. II of the *Journal* of the British Archæological Association, but these were swept away by Butterfield. Want of space prevents me from describing these vanished beauties. There is a Norman font of Purbeck marble showing an arcade of circular-headed arcades Butterfield was guilty of an absurdity in raising it to a considerable height and placing on a new base The east end is Early English, but the windows are Butterfield's work. There is a fine alabaster tomb of Sir Anthony Browne and his wife (1548). In the fifteenth century the north aisle was widened, and old glass remains in the top lights of the windows. There is a curious squint window in the north aisle which seems to indicate the presence of an anchorite's cell.

Mountfield Church, dedicated to All Saints, is a typical village church. The nave is Norman, having two Norman lights deeply splayed of the eleventh century. The chancel arch is small, with a plain abacus of the late eleventh or early twelfth century date. There are two pierced squints of the fifteenth century. The rear arch of the doorway is Norman, the tower low and squat, a common type in Sussex, with a wooden staircase, the treads and risers being solid pieces of timber of triangular shape. The chancel is Early English, the east window Decorated, but the tracery is modern. We noted the piscina, the seventeenth-century altar rails, the priest's doorway, and the unusual roof, which seemed to have anticipated the hammer-beam roof of the fourteenth century. It is very early. The rafters are hidden by plaster as in the thirteenth-century roof of the chancel. The font, which is large enough for total immersion, is Norman, but was ornamented later with Tudor flowers and shells.

There are very slight remains of Robertsbridge Abbey, founded by Alured de St. Marion in 1176. It was one of the three great Sussex monasteries dissolved in 1538. The existing remains are the thirteenth-century crypt, under the Abbot's Hall (now incorporated in a farmhouse), the ruins of the refectory and vaulting under the dormitory, the altar stone, and part of the precinct wall. The site calls for excavation, and it is good news that the active Sussex Archæological Society is about to perform the work.

Salehurst church is in many ways remarkable. It is a large church founded by the Cistercian monks of Robertsbridge for their tenants. It is large aisled, with six arches on each side. The mouldings are different. The arches on the south side date from 1200 to 1210, on the north from 1230 to 1255. The aisles were rebuilt in the Perpendicular period. There is some ancient glass depicting birds—a duck, falcon, etc. The chancel arch has been rebuilt, and the chancel is Decorated. The altar slab has been brought here from Robertsbridge Abbey, and serves as a pedestal for the credence table. The south porch is of oak with wooden tiles. The font is Norman and has three salamanders round the base and a wooden cover.

At Bodiam Castle Mr. Harold Sands, F.S.A., read a paper and led the company around the fortress.

The chancel of Northiam Church was modernised in 1835. The striking feature is the tall west tower with stone spire; iron stone was used in its construction, flanked with heavy buttresses. Part of the lower portion is believed to be Saxon.

By invitation of Major Frewen, the beautiful gabled half-timbered house called Blackwall was visited. In the evening a learned paper was read by Miss Rose Graham, who had the honour of being the first lady F.S.A. elected by that Society, on "Battle Abbey."

The first visit on July 2 was to Guestling Church, which has a modern appearance, having been greatly restored in 1884 and the interior rebuilt after a disastrous fire in 1890 caused by a defective heating apparatus. Some of the details are interesting, and the remains of old work, but the church is so modernised that it is not necessary to dwell on them.

Incklesham Church is full of interest. It was originally Norman, but has been altered and enlarged at different periods. The nave, aisles, tower and three small windows in the south aisle are Norman. The arcades date from 1130-40, and the circular piers have curious capitals of various patterns, including the ornate scollop of 1175 date. The tower dates from 1130, and is in three stages. There are double lights in the top story. The chancel is wide (1200 c.), and the stones are axe-tooled, not worked with a chisel. The corbels are interesting, composed of volutes, and seem of Eastern origin brought over by the Crusaders. The walls are lofty, and seem to indicate a Saxon date. The chancel is very large, and there are many other details.

At Winchelsea we first visited the Court Hall, the first building erected on the new site of the town with stones brought from old Winchelsea, which now lies beneath the waves. So much has been written upon the town that a detailed description is unnecessary, though Mr. Johnston most ably described the church, which is magnificent and contains so much of absorbing interest. A visit was paid to the ruins of the Greyfriars' House.

At Rye we were met by Mr. Adams and others who conducted us to the Land Gate, the Old "Flushing" Inn, the Town Hall, where we received a municipal welcome, and where the town maces and historical documents were exhibited, and then to the Church, Ypres Tower, and the timber houses of Watchbell- and Mermaid-streets.

Playden church has a transitional Norman nave (1180-1190) with aisles and central tower. The arcades are very similar to Rye church, with circular and octagonal piers. The west arch is pointed, but they all belong to the same period. The same masons who built Rye were evidently employed here. The font is Perpendicular, but it has probably been recut. A special feature is the carved screen, probably the earliest in Sussex. There is a grave slab to the memory of a Flemish brewer.

The chancel arch of Peasmarsh Church has the appearance of Saxon work, but Mr. Johnston pronounced it to be Norman. It is horse-shoe in shape, and has imposts with mouldings of the star pattern, and little mouldings beneath, a rather unusual arrangement. Two beasts are carved on the chancel arch, representing lions guarding the sanctuary. The piers of the nave are square with shafts at the corners. The chancel is Early English, but it has been rebuilt. We noticed the squint, piscina, blocked-up low-side window, and interesting sedilia. The priest's door has a segmental head, and there is a plain pointed recess in the wall which is rather a puzzle, probably a reliquary.

Udimore Church Mr. Ray described as a prebendal church of St. Mary in the Castle, Hastings. The plan suggests Saxon work, but it is purely Early English (*c.* 1300). There are nine lancets in the chancel, also an aumbry, piscina, low-side window, and a reliquary under the central lancet of the east window. The chancel arch springs from corbels. The south side of the nave was pierced for the formation of an aisle, but this plan was abandoned. The Norman piers have ornamented capitals of foliage similar to Guestling. There is an early twelfth-century north door.

Brede Place is an interesting house, which we were permitted to visit by Mrs. Morton

Frewen. Originally there was an open central hall with sixteenth-century alterations and additions.

Brede Church is of mixed dates, somewhat difficult to read. Mr. Johnston said that the oldest work was the Early English of A.D. 1200. In the north aisle there is a lancet, but all the other windows are Perpendicular, and there is no Decorated work.

The Oxenbridge window is exactly like the French flamboyant work. The south aisle of the chancel is the Oxenbridge chantry, and contains the fine monument of Sir Goddard Oxenbridge (1537) with his figure as a knight in armour and head resting on his helmet and his feet on a lion. His arms appear on the tomb, which is made of Caen stone probably worked by Frenchmen.

After dinner, Mr. John E. Ray delivered a very interesting lecture on " Old Hastings."

On July 3 we first drove to Bexhill, which most people imagine has no antiquities. There was, however, a church here in Saxon times. In 1878 a most interesting stone was found under the west arcade below the floor. Mr. J. Romilly Allen saw and described it. It measures 2 ft. 9 in. by 1 ft. 3 in., and is truncated. It shows wonderful interlacing work and dragons, and belongs to the Anglo-Saxon school of sculpture. It is very peculiar and the most important in Southern England. It was probably made in the North and brought down South by St. Wilfrid. Mr. Ray produced evidence from various charters to prove that there was a Saxon church here. A Norman church was built early in the twelfth century. The walls of the nave were pierced, and some herring-bone work disclosed, probably part of the Saxon church. The Early English chancel was ruthlessly destroyed in 1878. There were several chantries, one in an unusual place nigh the chancel arch, and one in the north aisle, which subsequently was used as a school in Elizabeth's time kept by Dr. Rye. Mr. Johnston stated that the church had suffered from horrible mangling. There is some ancient glass in a window in the north aisle which has had strange wanderings. Horace Walpole got hold of it for his " Gothic " mansion of Strawberry Hill. At his death it was sold and was taken to Hardwick House. Now happily it has been restored to the church.

A visit was paid to the Manor House of Bexhill, which formerly belonged to the Bishops of Chichester. There are several records of the visits of Bishops, and their steward lived there. It was erected in 1450.

At Pevensey Castle Mr. Harold Sands described that strong Norman keep within the Roman castrum. He had conducted the excavation of the fortress and had found it a very difficult undertaking. The church was described by the Rev. A. Evans, who said that there was a wooden Saxon church here. The present building was begun in 1170 and the work completed about 1270. There is a deep chancel with early English windows and wide aisles. The chancel is unusually long. The chancel arch is early English, and has capitals adorned with stiff-leaved foliage, the mouldings of which Mr. Johnston pronounced to be unique. The nave is remarkable for its mediæval beauty. After the Mise of Lewes, Pevensey Castle was besieged by Simon de Montfort, who did much damage to the church, which was restored in 1264 in the Early Decorated style. Green sandstone was the material used. The arch on the north was the entrance to a chantry destroyed at the Reformation and rebuilt.

Westham Church was visited and described by Mr. Ray. It is cruciform in plan, and on the east of the transepts were two horse-shoe-shaped apsidal chapels, now removed; but traces can be seen. The chancel, too, had a curved end. The windows are all Norman, but an elaborate Norman doorway has vanished. A scratch dial was pointed out. The church consists of early Norman and late Perpendicular. The transepts are small, and there is a fine west Perpendicular tower. The coarseness of the trefoils in some of the windows denote the lateness and degeneracy of the style. Mr. Johnston stated that the roof was unlike any other in Sussex. There were queen posts and curved braces, and seating plates resting on corbels, very simple and thorough. The east window has some original glass representing the Apostles. There is a charming ancient Perpendicular screen. The rood-loft has been reconstructed and carried too far forward. We noticed in the chapel a fine old altar-slab with the five crowns which for some time had been used as a tombstone, three piscinæ, some masons' marks, and outside a stoup, and a dedication cross under the east window.

We then journeyed to Eastbourne under the guidance of the Rev. Walter Budgeon, and visited first the house called "the Parsonage House," which was the manor house of the Rector of Eastbourne. It was built by Hugh Rolf (1519-49). Records of the house go back to the reign of King John.

Eastbourne church has undergone several restorations, and is a fine large building with chancel, nave, clerestory, and aisles, and is a good example of transitional Norman work (1170). The chancel arch is adorned with zig-zag. The capitals of the chancel have stiff-leaved foliage. In the fourteenth century were erected the sedilia, piscina and Easter Sepulchre, and the fine screens.

A visit was paid to the Lamb Inn, which has an early thirteenth-century crypt.

Jevington Church was described by Mr. Budgeon. It has a Saxon tower wider than the church, and resembles Barton tower, Lincolnshire, and shows herring-bone and long and short work. The nave is twelfth-century, and the chancel arch was formerly semi-circular. In the thirteenth century the north aisle was added. In 1872, £2,000 was spent, and a drastic restoration took place. In the north aisle there is a curious cross arch. The roof is very fine, of mediæval date, altered in the fifteenth century. It is a wagon roof of king-post and hammer-beam alternately. There is a curious piece of Saxon sculpture showing Our Lord bruising the serpent's head, the cross being driven into the mouth of the serpent.

The church of Hailsham was described by Mr. Johnston. It is mainly Perpendicular, but there are traces of an earlier church. It is mentioned in Domesday. There is some flint herring-bone work in the south wall of the nave, and the head of a very small window which may be pre-Conquest. It has been very heavily restored, and weird patterns carved on the piers. The arcade piers chancel arch are poor. The chancel is b with its piscinæ and sedilia excellently ca The twin capitals resemble those in the clo of St. Saviour's, Southwark, or in F and Spain. They are exotic and prob taken from some priory. The tower ar of reddish sandstone

After luncheon at Hurstmonceux, visited the castle by the permission of Co the Hon. Claude Lowther, M.P., which built in brick by Sir Roger Fynes in It illustrates the development of the f fortress into the manor house. The n bouring church is transition Norman Perpendicular windows. The capitals o piers resemble those at Battle, and probably carved by the same masons. south arcade is poor, but the capitals beautiful, and in the south aisle there fourteenth-century window, square-he The chancel has a modern look. The window is Perpendicular. There is a nificent tomb, with elaborate heraldry Thomas, eighth Lord Dacre, and his Gregory (1534); a fine brass (1402) to William Fienes with a Norman-French scription. The font, like that at Hailsh is peculiar to Sussex, early Decorated. side, the chancel and chapel are faced brickwork, and inside the tower. This pale yellow colour, and was brought over the Netherlands in the thirteenth centur

After dinner, Mr. P. M. Johnston gav interesting lecture on " Sussex Churches

On July 4 a very interesting day was s in the charming district of Romney Ma under the guidance of Mr. F. C. Elli Erwood. Brookland Church has a str timber detached belfry and a very impor twelfth-century font, which was describe Mr. J. C. Druce, F.S.A. Then Old Ron Church and then Lydd, called the " Cathe of the Marshes," an important little t the charters and documents of which we permitted to inspect, and New Romney H Ivychurch, Appledore, followed. In the e ing Mr. E. Reginald Taylor, F.S.A., rea excellent paper on the Cinque Ports.

On the last day of the Congress it arranged to utilise the morning by drivin Tunbridge Wells. We were thus enable see Echingham Church, a complete exa of a fourteenth-century village church; wash, with its Norman tower; Ticeh and Bayham Abbey of the Premonstrate Order, and with that visit the Congress to an end.

Design for a London Plaquette.
Submitted by MR. C. F. A. VOYSEY in the recent competition.

RITISH ARCHITECTURAL STUDENTS' WORK

By ARTHUR J. DAVIS, F.R.I.B.A.

HE exhibition of work of the schools of itecture in Great Britain and the British inions on view at Devonshire House connection with last week's International gress of Architectural Education, was of ptional interest, as it not only gave a fairly prehensive survey of the results obtained tter years by these schools, but naturally ed comparison with the foreign exhibits h were being shown at Grosvenor House. regrettable that it was not found possible how the entire exhibition under one roof, owing to the number and size of the drawings to the limitations of wall space this was not ble. As it is, only a restricted number of ings sent by the different schools were ayed,. but these were well selected by Hanging Committees and were sufficient to a general idea of the work completed during ast few years.

e exhibition as a whole was impressive by quality of the work shown, and proved lusively that the student of to-day is being ed in a vastly more efficient and compre- ve manner than was the case with the last ration. Our principal schools are rapidly ing architects who, when they have obtained practical experience inseparable from a prehensive knowledge of our art, will tually give us buildings worthy of our best tions. It is safe to say that already we challenge similar foreign institutions of older standing and reputation.

e main object of a theoretical training is o much to manufacture architects of genius raise the general standard of the profession, hat this object is being achieved cannot be ted by any impartial visitor to the exhi- n.

one who has followed with interest the opment of architectural instruction in this ry in recent times, it is gratifying to be o register an increasing progress towards a er and more scientific outlook, which is ent in the results of each successive n. The course of study has been extended e years, and the students are obliged to ement their theoretical training by spend- certain time in the offices of practising ects, where some knowledge of the e of architectural practice is attained. adverse criticism has been levelled at our s, but a visit to the exhibition cannot but ss by the variety of the subjects dealt nd the skill with which many complicated ms have been handled. A regrettable on is the absence of programmes of the es exhibited, as the subjects of many of signs have to be guessed, and this makes ent criticism difficult.

ough it may be advisable in exhibitions hitecture which appeal mainly to the l public to favour perspectives, photo- , and elevational drawings in preference lies in planning, I think this should not pplied where the principal object was to British and foreign architects the aims hievements of our schools. Nowadays is heard about the necessity for treating blems in a modern manner and discard- shackles of past tradition; yet we often ool plans which take no account of the on of modern practice and the use of nstructional materials which have altered ire character of recent buildings.

ome of the Dominion and provincial the students show a certain weakness handling of large planning compositions, cial attention should be given to this of architecture. In the design of and the treatment of interior decoration elp may be obtained from existing es, books, and other sources, but in the nception of a building and in the har- s disposal of its internal parts the archi- faced with problems which he alone is solve, and the real success or otherwise fforts will depend largely on his knowledge of planning in a logical and effective manner. I also note with regret that the study of domestic architecture has been somewhat neglected of late; this is to be deplored, as our superiority in this branch of architecture was acknowledged all over the world, and we should endeavour by every means in our power to retain our reputation in this field.

It is evident that the senior students of the Architectural Association and Liverpool Schools have acquired a knowledge of design sufficient to enable them to express their ideas without being hampered by a lack of skill in technical ability.

The works of the prize winners of the R.I.B.A. series of studentships were displayed in the entrance hall of Devonshire House. Most of these are already well known, and it will be unnecessary to comment on them in detail. They formed a very inspiring collection, and in most cases are remarkable for the excellency of their draughtsmanship and rendering.

THE ARCHITECTURAL ASSOCIATION.—On the landing and staircase and in Room No. 1 some of the recent works of the Architectural Association were to be seen. The professors of this school have evidently been able to inspire a strong feeling of enthusiasm in their students, and a large number of the designs showed a technical skill somewhat lacking in the work of the smaller provincial schools. I have picked out at random a few of the designs which I thought particularly interesting, but the limitations of space preclude my mentioning many other excellent examples.

Amongst the fourth- and fifth-year students the Italian Embassy by Mr. J. C. Shepheard, which won the Tite prize in 1923, is a skilfully handled scheme for a difficult sloping site.

A stadium, by Mr. H. John Harrison, the winning design for the Victory Scholarship, is a fine solution of this difficult problem. The plan is straightforward and economical, and the elevations are characteristic of the type of building required. Unfortunately the draughtsmanship and rendering are inadequate.

A town-planning scheme for an exhibition in Hyde Park, by Miss Chambers, shows that she can handle with considerable skill the difficult and complicated problem of town planning. Her treatment of the main roads and pathways is very effective. Unfortunately the position of the concert hall would block the view of the composition from the entrance avenue; this feature would have looked more convincing if it had been placed at the head of the main axis. A similar error has been committed at the Wembley Exhibition, where the Lloyds Bank pavilion entirely blocks the vista and spoils what might have been a magnificent approach to the Stadium from the entrance to the grounds. Amongst other good examples of her skill Miss Chambers showed a design for a town house, and an excellent study of a recreation centre, in which the façade is unworthy of the plan.

Mr. Thompson exhibited an elevation of a building for fine arts treated in a simple modern manner, with a well-balanced division of its masses. He is evidently somewhat influenced by the modern Dutch school.

Mr. Hislop's plan for a recreation centre, which was the programme for the Rome Scholarship in 1923, is direct and broadly handled, but his modern treatment of the elevation is not entirely successful. The large dining hall is insufficiently lit and would be improved by the omission of the small vaulted corridor in the front.

Attractive coloured treatments of a council chamber were shown by the Hon. H. A. Pakington and Mr. R. E. Enthoven. Mr. Enthoven is a host in himself, and his work occupied the whole side of one room and part of the staircase landing; he is evidently a very versatile and competent student. One of his plans, that of a headland hotel, is well adapted to the irregular site, but I would like to have seen how he has arranged his bedroom floors. The elevation is modern in character and well grouped, and the difference of levels has been considered with good effect. He also exhibited a charabanc station, and a charming little bungalow scheme. His Hyde Park exhibition plan is perhaps the least successful of his works, which included some good archæological studies.

Captain Lyle exhibited some charming rough sketches of a house on an irregular site treated in a most original and attractive manner.

Miss Sleigh's plan for a headland hotel has many good qualities, but the elevation is too massive and severe for the character required.

Mr. D. H. Beaty Pownall and M. F. Napolitano, both third-year students, showed spirited and imaginative designs for a doorway in a natural history museum.

Amongst the first-year students, Mr. E. Wamsby Lewis and Mr. E. J. Carter have produced some well-drawn archæological drawings of the Temple of Vesta and the order of Erectheon. A number of drawings of constructional details show that this branch is not neglected at the Architectural Association. As well as those I have mentioned there were many other designs of considerable merit exhibited by this School, which deserves congratulations for the excellent results it has obtained during the last few years.

THE LIVERPOOL SCHOOL.—In Rooms Nos. 8 and 9 were to be found many interesting examples of the work produced at Liverpool University, and if these appear to favour more academic lines than those of the Architectural Association the collection exhibited is amply sufficient to show the thoroughness of the architect's training in all branches of theoretical knowledge. To mention a few of the best examples:—

Mr. A. L. Gabb exhibited some well-executed drawings for a proposed repertory theatre in Cairo, showing a carefully elaborated scheme but devoid of special local characteristics, the building being of a type which might be designed anywhere.

"M.C.L." sent a rather ambitious plan for a recreation centre; dancing is not suggested by a mosaic floor in the main hall, and it would be unsuitable for a concert auditorium, as a view of the orchestra could not be obtained from the extremities of the room. The elevation is complicated and badly proportioned, and the arrangement of the terraces is faulty.

Mr. H. S. Silcock's design for a dining room on a "White Star" liner contains too many *motifs* and the scale is too small. The depressed arches are unsuitable for a ship, and the entire design would be improved by considerable simplification.

Mr. S. L. Bridgwater's plan of a fine art exhibition in South America is straightforward, but marred by the introduction of numerous unnecessary columns. His elevation is not of the same quality as his plan.

Mr. W. Dougill exhibited a well-arranged plan for a Royal Academy in the Beaux-Arts manner, also a carefully-drawn scheme for a city bank on American lines, somewhat unsuitable to this country, where more working space is required for the staff, the strong rooms being placed in the basement.

Mr. Stephen Welsh's drawings of a library over an open loggia in an Italian garden is an admirable study in the Italian Renaissance manner.

Mr. Richard Mique showed a beautifully-drawn and rendered elevation and section of the Belvedere-Petit Trianon, and Mr. C. C. Shaw's Carnavalet Museum is equally well done.

Some charming holiday pencil sketches of well-known streets and buildings were exhibited by Mr. Max Fry.

The details, both exterior and interior, of a ball room somewhat in the late eighteenth-century manner, designed by Mr. H. C. Bradshaw, are beautifully proportioned and full of charm, and these drawings were among the most interesting exhibits of the Liverpool School.

A fine specimen of draughtsmanship, in the Archæological Section, was to be seen in Mr. R. G. Heal's drawing of the Temple of Mars Ultor from the restoration by Mr. Chaussemiche.

The School of Architecture, designed by

Professor C. H. Reilly, is a noble building represented by a fine perspective drawing by Mr. H. C. Bradshaw.

LONDON UNIVERSITY.—Generally speaking, the work produced by the London University students is of a very high standard, and under the able guidance of Professor Richardson and Mr. Corfiato we may be led to expect even more excellent results in the future. Already many of the schemes sent in by this University show remarkable ability—for instance, the design for a school of architecture by Mr. F. S. Bardell is a fine plan, well grouped, if somewhat lacking in modern expression. Each department is in its place, and the entire composition is compact and easy to read.

Mr. Forster's plan for the same programme was also interesting. He has taken the *parti* of planning his studios around a closed court-yard on one side of the main composition. The handling of the motives is rather weak, and the planning shows a lack of knowledge of modern construction.

Mr. J. R. Alabaster and Mr. C. H. Short both showed some clever little studies of a dairy farm.

The design for swimming baths, by Miss Elsie Rogers, is based on a semi-circular plan with a simple and interesting elevation.

MANCHESTER SCHOOL.—Among the exhibits of this progressive school I noticed some carefully-drawn archæological details and two excellent studies of monumental doorways in the Italian manner. A design for a railway station by Miss Elsie Rogers deserves scrutiny. The plan is simple and straightforward, but the difficult problem of harmonising the stone elevation with the great metal vault of the concourse behind has not been solved in a convincing manner.

GLASGOW SCHOOL.—The Glasgow School has shown some good classical studies, together with designs in architectural composition, which are somewhat weak in expression. The plan for a Parliament building has merit, but is marred by its unpleasant colouring.

ROYAL ACADEMY SCHOOL.—In the room devoted to the work of the Royal Academy School of Architecture were some delightful water colour sketches and a municipal theatre design by Mr. Cyril A. Farey, together with a study for a Propylæum in Greek Doric, well proportioned and of good draughtsmanship.

Owing to the lack of space at my disposal, I cannot deal with the work of the smaller schools of the provinces and Dominions, but in the rooms allocated to their work there were many drawings worthy of examination, and I am sure that an hour spent at Devonshire House amply repaid the visitor and surely proved that the education of the young provincial architect is in very competent hands.

BOOK REVIEW

Architecture Series of Measured Details. Drawn by WALTER MCQUADE. (London: B. T. Batsford, Ltd., and Charles Scribner & Sons, New York.)

This is a portfolio of twenty-four large plates of details of modern American architecture, drawn to scales ranging from ½ in. to 3 in. to the foot, and having on each plate photographs of the work as seen as a whole. They represent work of renaissance character, and include examples from the New York City Hall, the Municipal Building at Hartford, a public library at Montclair, and from houses at Albany, Louisville and Long Island. The details are chosen from external colonnades, doors, door-ways, windows, mantelpieces, &c., and together form an excellent collection of modern American work, though we could wish to have seen included among them some examples of the productions of Thomas Hastings, Charles F. McKim, or Richard Morris Hunt.

Church of St. Helen.

The Church of St. Helen, of which Mr. W. D. Caröe, M.A., F.R.I.B.A., is the architect, is from this year's exhibit at the Royal Academy.

Rest Houses, Halstead.

These rest houses, twenty in number, have been erected on the site of the old workhouse and infirmary in North-street, Halstead. They are arranged in five blocks with four houses in each block. In the middle of the centre block is a fine oak-panelled room, to be used as a common room or room for trustees meetings. The view is taken looking along the terrace in front of the centre block and shows the bay window of the common room. The different blocks are connected by timbered porches or garden houses, and there is also a timbered garden house at the end of the blocks nearest the road.

The contractor was Mr. C. Deaves, of Bures, Suffolk; the facing bricks are 2 in. Tudor bricks, supplied by Messrs. Ames & Finnis, of 37 & 38, Strand, W.C. 2, who also supplied the roofing tiles and carried out the tiling.

The architect is Mr. E. W. Coldwell, Lic. R.I.B.A., of the firm of Messrs. Coldwell, Coldwell & Courtauld, 83, Pall-mall, S.W. 1.

St. Andrew's Church, Sudbury.

The original intention was to carry the main roof upon wooden posts, after the manner of St. Mary's Hall, Chichester, or the Town Hall, York, but light stone and brick arcades have been substituted as being more ecclesiastical in effect, and perhaps more permanent. The original design is not abandoned without regret. The accommodation is by no means cramped, and there is plenty of space about the entries, yet it is believed the cost will be well within £20 per sitting inclusive, not including an organ. During last year a vicarage was built at an inclusive cost of under £2,000, and as the parish hall already exists the erection of the church will complete the equipment of the parish.

The architect is Mr. Chas. Waymouth, F.R.I.B.A., of 104, High Holborn, W.C. 1.

Royal East Sussex Hospital, Hastings.

The general contractors are Messrs. Peerless, Dennis & Co., Grove-road, Eastbourne; sanitary fittings, Messrs. Pontifex & Co., Shoe-lane; electric fittings, Mr. F. J. Wordley, St. Leonards; heating and hot water, Mr. Mathew Holt, Wigmore-street, London; lift, Messrs. Pickerings, Ltd., Stockton-on-Tees; windows, Messrs. Crittalls; operating theatre, Messrs. T. Sclaters Sterilisers. The cost was about £80,00 The architect is Mr. John Saxon Snell, F.R.I.B.A.

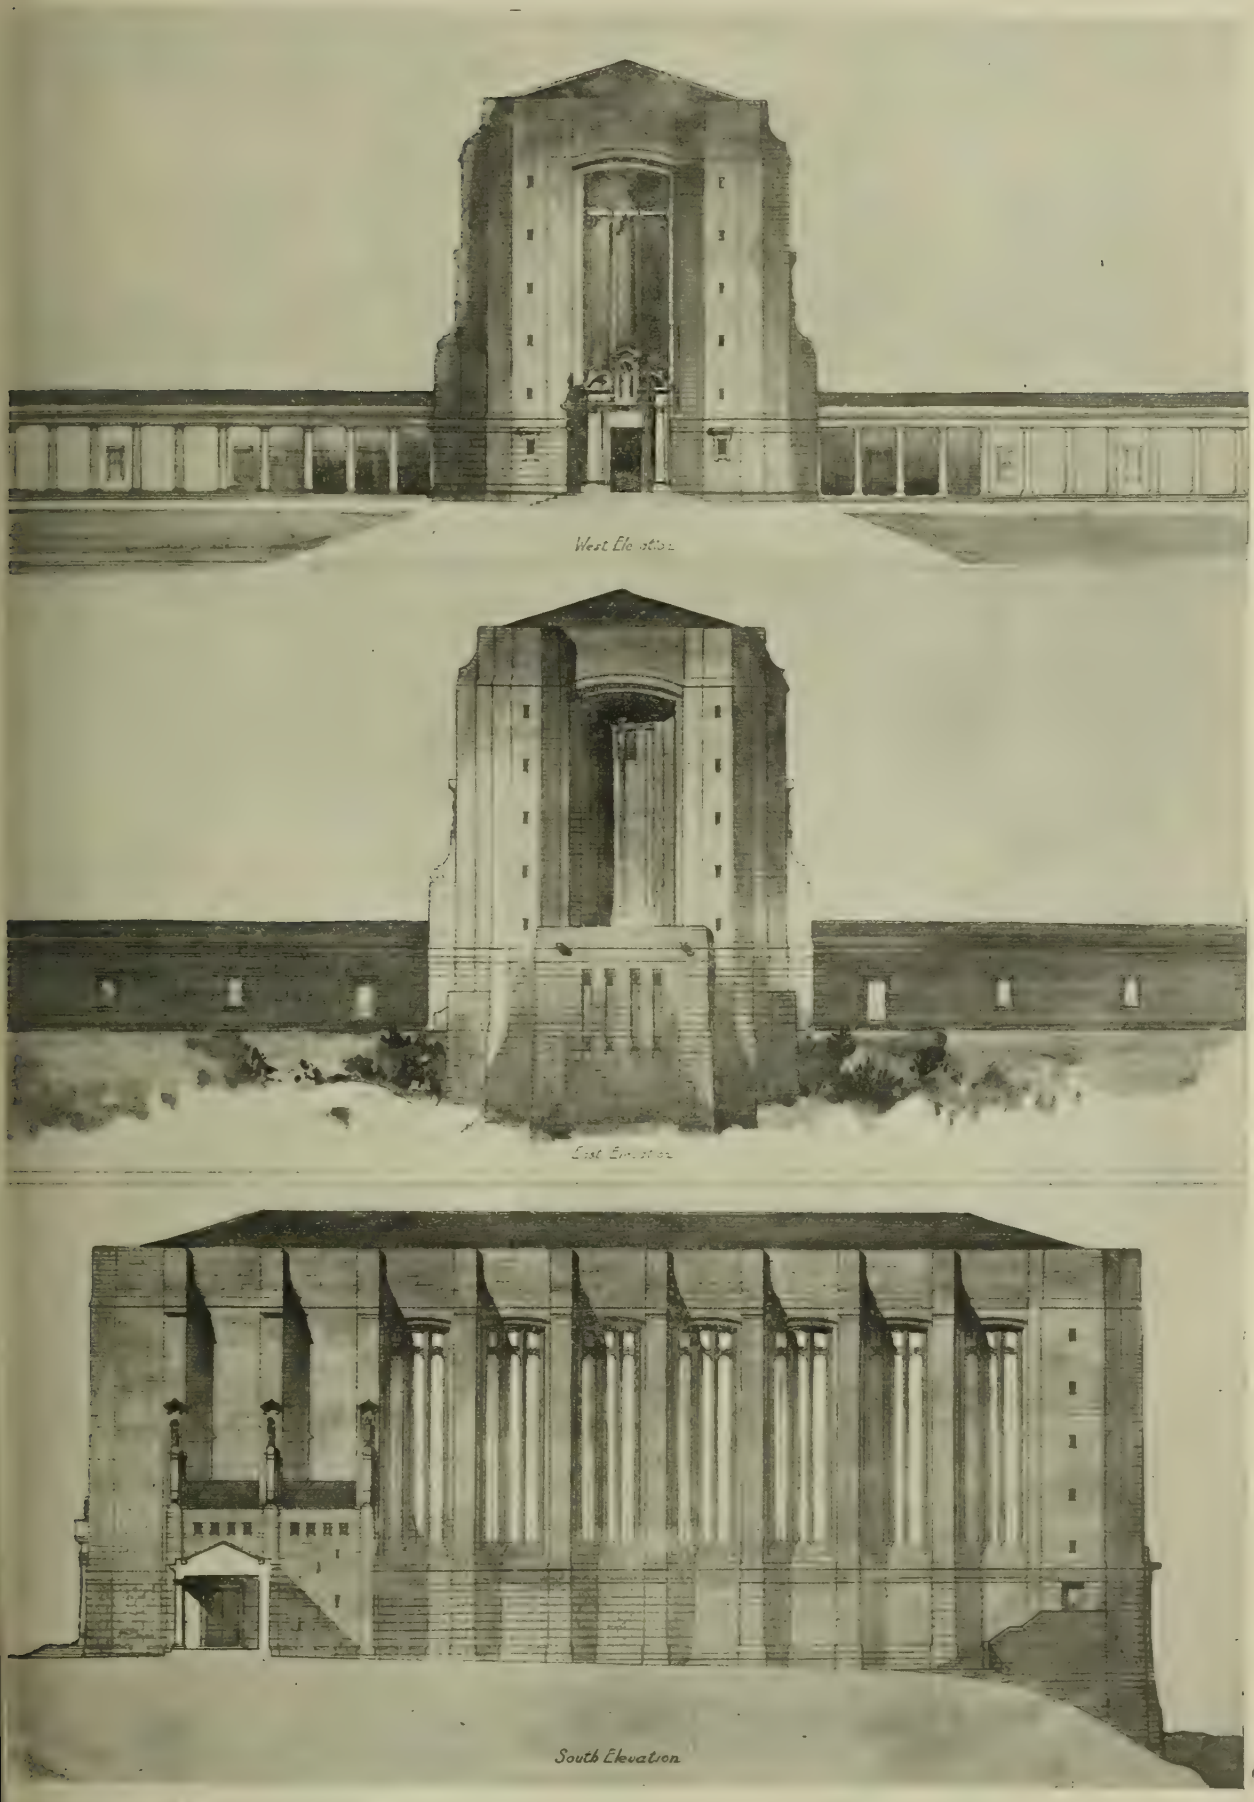
Jarvis Studentship.

We illustrate this week the selected desig by Mr. M. A. Sisson (London University Sch of Architecture), for the Jarvis Studentshi The designs submitted are on view at t R.I.B.A. Galleries until August 15. T Scholarship in Architecture has not Ro been awarded this year.

A WREN MEMORIAL

LAST Friday the Earl of Crawford unvei in St. Paul's Cathedral a tablet to Sir Christop Wren, presented by American architec The plaque which the Dean and Chapter h received is of bronze, the border represent a wreath of golden rod and oak leaves entwin The gift of the Architectural League of N York, it bears this inscription, "In recognit of the inspiration and enduring influence u American architecture of the work of Christopher Wren, this tablet is inscribed the Architectural League of New York."

The service of dedication was conducted Dean Inge, assisted by Canon Alexander Canon Newbolt.



The Earl of Crawford, in unveiling the me rial and committing it to the charge of the D and Chapter, said it was a testimony to strength and vitality of Sir Christopher Wr influence, and though they recalled the fam admonition against a memorial of his achi ment, and the plea that his work, rather t his personality, should carry his recollec onwards to future generations, they m direct their minds to his memory on this where "Thro' the long-drawn aisles and fre vaults, the pealing anthems raise the not praise."

To-day they stood beside the very he pulse of the throbbing life of this great continued Lord Crawford. In imagination them carry back their minds to this same in the days when the genius of Wren walke streets. He knew the city decimated by pla shattered by death, devastated by fire, and the ashes of its despair he raised this monument to the hope of immortality. M generations had passed through the life o Cathedral, each adding its tribute of praise their words were but rippling waves pa over the unfathomable depth of his great Indeed, so great a master was he that might almost say of him as was said o Greatest of all and His followers, "He before, and they were amazed, and as followed they were afraid." In that dark of their history the genius of Wren took hovering like some great spirit over the sce desolation, surveying its ruins, and conce its massive reconstruction. Creation foll creation, each excelling its neighbour in str and grandeur, in grace and fidelity. So city of death became the envy of the wo architecture.

Among those present at the ceremony Mr. Alfred C. Bossom (Chairman of the Fc Activities Committee of the Architec League of New York), Mr. J. A. Gotch dent, Royal Institute of British Architects Brumwell Thomas, Sir George Frampto Mark Short, Mr. Mervyn McCartney, the Walter Scott, Sir William Berry, Visco Maitland, Lady Frederick Lewis, and Clara Butt.

Plymouth Housing.

Negotiations were completed recently f purchase of the Randwick Park estate acres. It is to be developed for buildin poses, and the intention is to erect upon it of the semi-detached villa type, with gardens.

Marble Pavement at Liverpool Cathedral. Sir G. Gilbert Scott, R.A., Architect.

Marble pavements at Liverpool Cathedral are carried over the public space, north transept, south transept, choir, choir aisles, and chapter house. Hopton Wood stone and Belgian bird's-eye fossil marble are used. Sienna marble is used in banding-up the panels, and was specially picked so that the maximum of warmth and colour was obtained with the minimum of black pencil figure. Rosso antico is used in the pavement to the Chapter House. Marble inlay is used in the form of two inlaid devices in the altar platform of the Memorial Chapel, and one in the pavement of the Choir. The marbles used in the inlays include sciavezza statuary, rosso antico and sienna, caroline and lunel rubane, blood-red skyros, Hopton Wood and bird's-eye from England.

These floors were executed by Messrs. John Stubbs & Sons, of Liverpool.

WESTMINSTER ABBEY RE-EXAMINED—VI.

By W. R. LETHABY.

THE CONFESSOR'S CHURCH.

EXISTING REMAINS.—The Monastery at Westminster was founded by King Edgar. It is possible that there had been some small church on the site before, but the evidence for this is very doubtful. Dean Robinson writes in "The Times of St. Dunstan" (1913), "After Edway's death in 957, the kingdoms were reunited under Edgar, and Dunstan became Archbishop of Canterbury. The monastic movement now went forward rapidly." At Westminster were many precious relics which were said to be the gift of King Athelstan. "Now it was not until Athelstan had been in his grave for twenty years that Dunstan took Westminster in hand, and brought monks, probably from Glastonbury, to dwell there. Till then there was but a small church there of no significance. Dunstan himself is not among the donors of relics . . . but it is possible that he had part of King Athelstan's treasury of relics at his disposal, and may have given some of the items mentioned in his old master's name."

In the first half of the thirteenth century, Abbot Barking gave some hangings for the Choir on which the life of Christ was figured, and also the story of St. Edward. The last subject of the latter represented the founders of the Abbey. In a copy of the inscriptions (seventeenth century), the writer says, "The ffounders names of Westminster were theis: King Edgare, King Edward, and ye Archbishope Dunstane." This information he doubtless found on the tapestry itself, and it gives the early thirteenth-century tradition.

Edward the Confessor rebuilt the church in emulation of the great monastic buildings of Normandy. In *Gleanings*, Sir G. Scott discussed a description of the church—given in a "Life" of the Confessor, written not later than 1070—and its relation with the existing "Norman" buildings. He came to the conclusion that the scale of the plan was much the same as that of the existing church, but that the Confessor only built the eastern part including the crossing and transepts. In 1866, Scott found the bases of some piers of early Norman form, under the mosaic floor of the Presbytery, which, as he saw, could only be actual remnants of the Confessor's Church. In 1894, Micklethwaite planned these piers in their relation to the existing "Norman" buildings, and set out a tentative reconstruction of the whole church.

In 1906 I suggested that, if we seek for a direct prototype, it is probable that we should look to Jumièges, a famous church, founded by Robert, who became Archbishop of Canterbury. Like Jumièges, its prototype, Westminster probably had an effective triforium story. In a letter written to the Pope to obtain Edward's canonisation, in 1165, it is described as a noble building, which the King had *beatissima consummavit*. A spurious charter of later days mentions Godwin Great-syd as having been the master-mason (*cementarius*). I accepted the view that the Confessor had not completed the church.

In November, 1909, I published a short study of the Confessor's Church (*Journal*, R.I.B.A.), following an account of excavations at Jumièges in *Bulletin Monumental*, July, 1909. This is now given in a condensed form.

"The stumps of the piers of the Confessor's Church have convinced me that they were probably parts of wall-piers once attached to a closed-in presbytery. They consisted of pilaster-strips with bold half-rounds in front; although in themselves they might have belonged to isolated piers, it is almost impossible to imagine the chance which should have led to just these members surviving while the rest of such isolated piers were entirely grubbed up. Of the two piers on the north side, being the first and second from the crossing, the second is different in having to the *west* an additional member, so that it projects forward or south about a foot in front of the other pier. These facts can best be explained by supposing that the second pier represents the respond of an apse terminating a closed presbytery. (Fig. 1.) The force of the evidence will be appreciated by comparing it with the plan of Cerisy, and the prototype of Cerisy was Jumièges. According to this reading

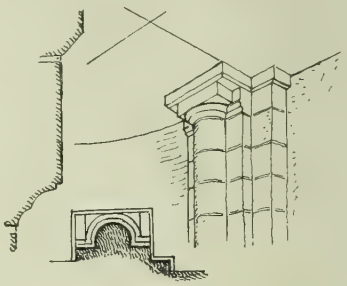

FIG. 1.

the bays of the Confessor's Church would have been about 17½ ft. wide, and the site of the altar would not have been moved by Henry III. The old presbytery would then have been of the normal two-bayed type found in early Norman churches. Thus, too, the site of the old altar conditioned the short presbytery of the present church, an extraordinary feature which has never been explained. The plan so obtained coincides perfectly with that of Jumièges. The word *ambitus* in the description of the church referred to the aisles [and not as had been supposed, to an ambulatory round the apse. See below]. In the Jumièges type they were continued even across the ends of the transepts. The ambulatory plan did not reach Normandy till about 1070 and England about 1080. The form of the piers and the profile of the bases bear out the evidence of the plan; the base made only of two hollows, is found at Caen, and it is *the* base at Jumièges. The facts gathered up show that Westminster was a copy of Jumièges."

In February, 1910, Dr. Armitage Robinson, then Dean of Westminster, read a paper before the Antiquaries, in which he gave the results of a visit to Jumièges. From measurements taken there he prepared a restored plan of the Confessor's Church. "It appeared certain that at Jumièges the original presbytery consisted of

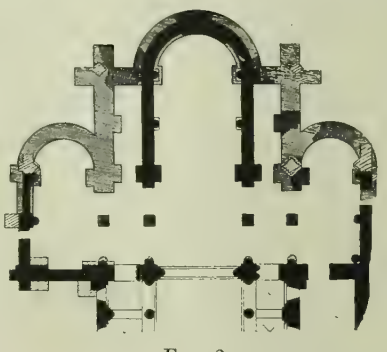

FIG. 2.

two bays and an apse." A little before this time M. Roger Martin du Gard published a monograph on the Norman Abbey, giving the result of recent excavations. From this my Fig. 2 is taken. Dr. Robinson, in his paper, analysed all known written sources regarding the Confessor's Church and came to the conclusion that it had been completed before King Edward's death, although in the eleventh-century description the older Saxon church is said to have been left standing to the west.

After Dean Robinson had read his paper I suggested that a search might be made for the foundations of the Confessor's apse und disturbed piece of pavement just behind present altar screen. I had observed that the two stumps of piers on the north side, more eastward one had an additional brea its western face and projected further, so the space between the eastern piers on opp sides must have been 2 ft. 6 in. less than space between the piers further west. It s obvious that the pier to the east must have one of the responds to the arch opening t apse, and a comparison with a series of Norman plans fully confirmed this vi (Fig. 1.)

In searching for the apse we found that u the mosaic floor the ground had been mad for several feet by a filling of stone chips a mason's yard; at a depth of 5½ ft. reached the flat surface of a hard mass follo a concave curve. We now dug deeper alon curved front of this hard mass and found it was a foundation-wall of concreted r largely of flints. The upper surface of

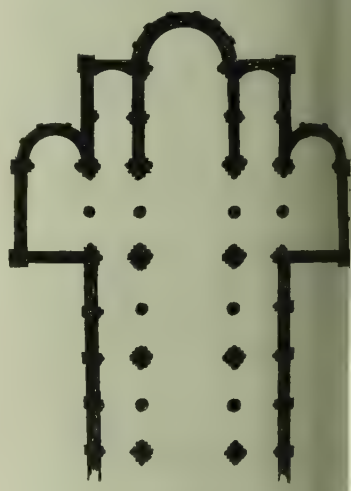

FIG. 3.

remained was in part covered with b Roman tiles. A total depth of 7 ft. 8 in reached and here we seemed to come to turbed sandy loam. The foundation must projected about 1 ft. 6 in. from the surface apse wall. In digging the hole several pieces of Roman tiles (bricks) were found one fragment of a Roman roof tile with fi sides, and some lumps of a floor of *signinum*—that is, of mortar and broke about 3 in. thick. It is evident that must once have been an important R building on the site" ("Archæologia," Vo

Since this plan of Westminster (Fig. established other churches of similar form been explored. Mr. Bilson described the p the early Norman church built at Linc "Archæologia," XLII. The presbytery its aisles was of the same form, but a bay l and the apse was narrower, as at Westmi the aisles ran on past the transepts, Jumièges and Bayeux (see an original pl Blouet in the Print Room at South Kens Museum), and probably at Westminster. recently the foundations of an eleventh-c Norman church of the type have been exc at Wenlock (Fig. 4, based on "Archæolog

FIG. 4.

CRIPTION.—The eleventh-century descrip-
f the church contained in the *Life* of the
sor was first printed by Camden "from
cient manuscript." Wren put it into
h thus :—

e principal area or nave of the church,
aised high, and vaulted with square and
n ribs, is turned circular to the east; this
h side is strongly fortified with a double
g of the aisles in two stories, with their
and arches; the cross building contrived
tain the choir in the middle, and the
to support the lofty tower, rose with a
and lower vaulting, which tower, then
ng with artificial winding stairs, was
ied with plain walls to its timber roof,
was well covered with lead."

Iowel's "Londonopolis," 1657, I have
version earlier than Wren's, given from
ld manuscript book," doubtless through
n: "The principal plot or ground-
f the building was supported with most
rches, cast round with four-square work,
nblable joints. But the compass of the
with a double arch of stone on both sides,
osed with jointed work, firmly knit and
together, every way. Moreover, the cross
church, which was to compass the mid
f those that cnaunted unto the Lord,
th a two-fold supportance, that it had
er side to uphold and bear the lofty top
ower in the midst, simply riseth at first
ow and strong arch; then mounts with
r, with many winding stairs, artificially
ng with a number of steps. But afterwards
single wall, it reacheth up to the roof of
well and surely covered with lead."

the "Life" of the Confessor was
n the Rolls' series, it was found that the
ion of the church in the MS. used
a little from that given by Camden.
's began, "*Princ palis domus area*";
er had "*arae*." The new text also had
tional passage.

passage in the "Life" has often been
and analysed—most fully in Dean
n's paper in *Archæologia*. I am quite
tent to deal with it as a whole, so I only
re the first part as a necessary key to
ollows: (1) Principalis arae domus
us erecta fornicibus quadrato opere
commissura circumvolvitur; (2) am-
item ipsius ædis duplici lapidum arcu
ue latere hinc et inde fortiter solidata
compage clauditur; (3) porro crux
. . .

has been interpreted in several quite
ways, but there is general agreement
ne latter part not given here.

ew text was printed in *Gleanings* (1863),
editor (J. H. Parker) observed of it:
s *arae*, literally the house of the Altar,
y means the choir, whereas Wren had
for the area or nave. From other
it is clear that the Choir was the only
ished at the time of the dedication."
xt mentions the cross and the central
ver the *Choir*, and hence Parker must
ed this word to include the transepts
ssing.)

04 Mr. Micklethwaite adopted this inter-
n in a version which otherwise closely
Wren's. I give his opening sentences
nding to the part of the text printed
"The main building is rounded and
th very high and uniform arches of
ork, and the aisle enclosing that part
ly vaulted with a double arch of stone
from either side, right and left. Then
s of the church . . . ."

09 the late Mr. Francis Bond objected
was a mistake to imagine that *arcus*
"a vault," and *fornix* "an arch."
eaning of the words, *principalis arae*
lissimus erecta fornicibus circumvolvitur
he sanctuary (home of the high altar)
vith vaults very high and is surrounded
." These vaults, he goes on to say,
have been those of the ambulatory,
were no high vaults in 1050.

thwaite supposed that the arches or
question must be those of the main
(Parker's *Choir*), and that, therefore,
they could be no other than the four great arches under the Lantern tower, which, as all agree, surmounted the crossing of the church.

Dean Robinson, in 1910, followed Mr. Bond in making the description begin with the presbytery, but he claimed that "the very high vaults" must be those of the presbytery and the apse. It had now been discovered that, at Westminster, there had been no ambulatory around the apse, such as Mr. Bond assumed. I copy here this latest translation in full :—

"The sanctuary of the high altar rises up with very high vaults; it is made with squared stones and even jointing, and is brought round in a curve.

"But the main church is compassed about with a double stone arching on both sides, and is closed in, this way and that, by solid work of strong construction.

"Then the crossing, which is to contain in the middle the choir of those who sing God's praises, and with its two-fold abutment on either side to steady the lofty summit of the tower in the middle, rises simply at first with a low and sturdy vault, swells with many a winding stair of elaborate artifice, but then, with a simple wall, reaches the wooden roof, which is carefully covered with lead. Above and below projecting chapels are arranged, to be consecrated by their altars to the commemoration of apostles, martyrs, confessors, and virgins.

"Now the whole of this vast and elaborate work was started so far east of the ancient church that the brethren of the place might not have to cease in the meantime from the service of Christ, and also that some part of the porch which was to be set in between might have room to follow on."

What does the opening phrase of the description refer to—the highest and most characteristic part of the whole structure, as Parker and Micklethwaite supposed, or to the eastern limb of the building?

I am incompetent to deal with the question and should not pretend to do so were it not for fresh evidence. This I find in what Enlart tells us of early churches in France: "At times a lantern tower giving light to the church surmounted the crossing; it may have been a Gaulish version of a central dome. It was called *turris*, *domus altaris*, or *domus arae*, the altar being placed below; the tower had a pointed roof, *turritus apex*." ("Manuel," vol. 1, p. 118). See also "*Cabrol* under *Domus*."

The lantern-tower of a Romanesque cruciform church, like a Byzantine Dome, rose over the centre of the structure, having windows through which much of the light was derived. Wilfrid's Church at Hexham is described as a round *tower* with four projections surrounding it. The late Saxon church at Durham had two towers, one of which contained the choir. The Saxon church at Ramsey also had two towers—one being central. The characteristic feature of the Saxon cathedral at Winchester was "a lofty *temple* full of light—a sparkling tower reflecting the rising sun." The picture in the "Benedictional of St. Ethelwold" shows clearly that the church had a tall central tower as well as a second one, which was doubtless at the west end.

The lantern, with its windows, is here identified with the temple or main structure, just as in the Westminster description it represents the *domus*. The same general idea seems to be followed in a description of the Saxon cathedral at York, about 970, also given by Willis.

"A wondrous basilica was completed. This house of appropriate altitude is supported by solid columns set under curved arches . . . within its beauty shines environed with many aisles (or apsidal chapels). It has a great number of apartments, which contain thirty altars."

This leads off naturally as, I suppose, the Westminster account does, with the height of the "house," and, in fact, it might be the model for the Westminster description. Of Lanfranc's Church at Canterbury, we are told, although it had a long nave, "the tower, raised upon great pillars, is placed in the midst of the church like the centre of a circle. . . . A gilded corona hangs in the midst of the church."

The relation of Domus, Dome, and Lantern-tower is well brought out in Walcott's "Sacred Archæology." "*Dome*: A cupola, probably so called as being the distinguishing ornament of the cathedral; the Italian *Duomo*, the German *Dom*, and Latin *Domus dei*, God's house, the *Dominicum* of St. Jerome. . . . It became the lantern of English Gothic art, but is closely approached in the superb lantern at Ely." "*Lantern*: An open central tower, as at Ely, Coutances, Lisieux, Evereux, Lincoln and York, for showering down light on the choir and rood. On festivals an immense lamp was suspended from the vault of the tower at Beauvais and was visible at great distances at night—a beacon that could not be hid."

It is curious that Howel, who was quoted above, uses the word "dome" for Old St. Paul's and also for Westminster Abbey.

John Carter, a century ago, noted of lantern towers: "There is a part of our antiquities which seems to have escaped general observation—the interiors of central towers. Hiding them by ceilings seems to have been first resorted to, temp. Henry VI and Henry VII, and many fine groined ceilings were then set up, as at Canterbury, Gloucester and Wells. The central tower at Durham, still open, is the diadem of masonic power." The name Lantern-tower occurs in the Rites of Durham, and in the Will of Henry VII it is used for Westminster.

We are now better prepared to understand what the writer of the *Life* must have meant by the opening words of his description. We should note first of all that there were no other introductory phrases dealing with the main building. The account begins by saying that the King rebuilt the monastery not far from the walls of London and then at once proceeded as above quoted. I venture now by comparing the several versions, and with the help of a dictionary, to put down what I suppose the writer must have meant.

The House of the High Altar (sacred structure, or, as below, "temple") is raised extremely high with vaults (or broad arches) of squared work closely jointed (round about the four sides of the central space). The edifice is also enclosed on both sides by double arches of wrought stone, solid and strong. Moreover, the cross (or transept) of the temple, which contains in its midst the choir of those who sing to God, with twin supports from each side, upholds the lofty middle tower: first (on either side) it has a low and strong vault, then rises with many winding stairs artfully ascending and continues with a simple wall up to the wooden roof, which is well covered with lead. Below and above chapels are thrown out to be consecrated by their altars to the memories of apostles, martyrs, confessors and virgins. All this vast and complex work was planned far to the east of the old temple that the brethren need not cease from the service of Christ, and so that a sufficiently spacious vestibule might be placed between them.

The great arches of the crossing under the lantern would have been six or eight feet broad on the soffit, and an untechnical writer even now might be confused in describing them as to the precise use of the words "arches" and "vaults." As the word *fornicibus* is plural, Dean Robinson explained it as applying to high vaults over the whole of the presbytery and its apse. If I could believe the presbytery had high vaults, then I could also think that the little transepts were also vaulted, and thus again we should be free to suppose that the description started with the main building. Apart from other considerations, the existence of high vaults at this time seems to me more unlikely than the use of the word *fornicibus* for the arches—great and high and altogether remarkable—which were about the square crossing.

Further, it is these arches or vaults which appear to be described as constructed of carefully wrought stone. Now arches would have been so built while main vaults would not. Dean Robinson alone makes this wrought masonry apply to the walls.

Again, Dr. Robinson understood the second sentence, *Ambitus autem ipsius aedis . . .*, which he rendered, "But the main church is compassed about . . ." to apply to the nave,

while the third sentence came back to the choir. Yet in a monk's church the nave hardly counted, while the choir was essential.

Besides describing the Confessor's work at Westminster, I want to bring out the thoughts which conditioned the design of our ancient churches. The dominating position in every way of the central tower and its parallelism with the eastern dome has hardly been realised. It was much more than a handsome feature in "a design." In some of our smaller Saxon churches the body of the work is a tower with a projection for the altar at one end and a porch at the other, and these have been well named "Tower churches." It is part of the same tradition that in churches like Westminster the choir of singers is in the western limb of the building.

While speaking of Saxon cruciform churches, I may add that the foundations at Peterborough may be explained by supposing that the transepts were not wider than the nave, but had sacristies or chapels which made up the greater width found. Were not the foundations at York, which Micklethwaite supposed to be Saxon, part of Bishop Roger's work?

THE NAVE AND TOWER.—The *Life* description of the Church is usually said to have been written about 1070, but Dean Robinson pointed out that there is no reference to the Conquest and that it is quite possible it was written before the end of 1066. In any case "the writer's description does not come at the end of Edward's life, but while the work is still in progress. . . . But we may not assume from this that when he wrote the things described were only in contemplation. He is describing the process of building." Dean Robinson also pointed out that Sulcard, who wrote about 1080, said "the work that had been begun was pushed forward by the King's command, and after a few years, supported on divers columns and vaulted with manifold arches (*multiplicibus volutum hinc et inde arcubus*), being finished to the very porch (*vestibulum*), it was shown forth to the bishops for consecration." I wonder whether *vestibulum* here and in the earlier description necessarily means a western porch? I find it hard to think that the older Saxon church was still further to the west than the *completed* nave of the Confessor's church. Dean Robinson speaks of "room for the Saxon church between the Norman west front and the Long Ditch, a distance which may be reckoned as from 300 to 350 feet." If we could suppose that *vestibulum* might here stand for nave, which otherwise does not seem to be mentioned, then we might understand that a part of it was first interposed between the old church and the new, and then the former was pulled down for its completion. Sulcard, indeed, says that the old monastery "which we have all seen, was purposely destroyed that the nobler one might rise, which now we see." In Parker's "Concise Glossary," it is said that vestibule sometimes meant nave, but this meaning is not given by Ducange.

A slight confirmation of this view may be found in the fact that in the Confessor's *completed* church there was an altar dedicated to the Trinity. Now a legend told that it was at the altar of the Trinity that the Confessor saw one of his visions. This would mean in the old Saxon church, for the Confessor never entered his new church after its consecration. It seems probable, therefore, that the site of the older Trinity altar (possibly in a lateral eastern apse) was considered to be represented by a nave altar in the church built by the Confessor. The event is represented by one of the sculptures on the back of the existing altar-screen, and it there looks like a nave-altar. The Trinity altar is mentioned in 1246 as being the place where the Confessor saw as in a vision the King of the Danes drowned. (B.M. Cal. "Charter Rolls.")

Again, remains of Roman building have been found half-way down the nave, and the Saxon church is likely to have been on a Roman site, which seems to have been the highest point of very low ground.

This reading of the evidence, however, requires that the Vestibule spoken of between the Confessor's work and the old Saxon church should be understood to mean a part of the incompleted nave to the west of the Choir gates. Possibly only the actual altar and not the chapel of the Trinity was preserved.

That the Confessor built at least a considerable part of the western limb of the church is confirmed by the Bayeux embroidery on which the church is carefully represented. In a study of this work in the *Archaeological Journal*, about ten years ago, I convinced myself that it was an English work wrought to the instructions of Odo, Bishop of Bayeux, soon after the conquest for his cathedral. (Its subject was Harold's oath on the relics, and what followed, rather than the Conquest of England seen politically).*

Of several buildings indicated on the embroidery the only one which is represented with any appearance of accuracy is the Confessor's church. It is properly shown close to the palace, which lay just to the east, and it is familiarly named "the Church of St. Peter."

Five bays of the western limb of the church are shown. These, it is true, might stand for a greater number, but no completion by western towers is indicated. The view correctly represents the facts that the church was cruciform and had a tall central tower standing over high arches. The upper storeys of the tower were reached by turret stairs projecting at the angles, and above it was finished by a steep leaded roof. The western limb had arcades and upper windows, but the eastern limb, which was short, had no arcades.

All this agrees with the evidence otherwise gathered. The tower had two stages of lights, and it can not be doubted that it was a "lantern." It may be compared with the noble early lantern tower of St. Albans, and also with that of Jumièges, the parent of both.

The importance of the lantern tower at Westminster, as brought out both in this view and the old description, is confirmed by the fact that Matthew Paris, telling in the "Major

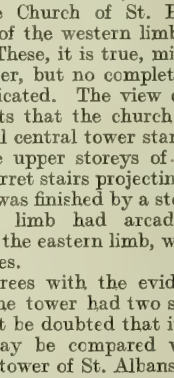

FIG. 5.

Chronicle" of the beginning of the new work of 1245, says that the eastern part of this old church was pulled down, and adds in the margin, "*cum turris.*"

Another little detail which may be gathered from the embroidery is that the church had a weathercock (Fig. 5).

It has been held hitherto that the scale of the Confessor's plan was nearly the same as that of the present church, but this may, I think, be proved to be a mistake. One piece of evidence I gave last October in showing that the south wall of Henry's III's church against the Cloister must have been built outside the older church. This is substantiated by two further facts. About ten years ago we found by an excavation in the north walk of the Cloister that the outer wall of the west walk of the Norman cloister ran for some feet under the present north walk of the cloister, and it was not traced to the angle. Again, the t of early Abbots seem to have been shifted Henry III to the south walk of the cloist suppose they originally lay by the w the church, but were displaced when i widened.

The dimensions of the Confessor's wo Westminster, which may be stated with accuracy, are these: Internal width o presbytery, 31 ft. 2 in.; its external about 40 ft. Internal length of presb comprising two bays and the apse, about Width of bays in presbytery at 17½ ft. external width of the existing Dormitory which ran away from the south transept was probably of the same dimension) is 3 that is about the same as the presbyte might be expected. Now these agree c with the dimensions of the similar par Jumièges, and we may not doubt that th churches were closely alike in size. So we transfer other dimensions from the Ne church to Westminster with high proba of their being correct. At Jumièges the was about 66½ ft. internally, and about externally. Dean Robinson, however, g width of 72 ft. to the Confessor's nave at minster, nearly as much as the present which is 73½ ft. The width of 66½ ft. see be the greatest known for contemporary Ne churches (see J. Bilson's "Lincoln," in *A logia* 62), and it may be doubted wh Westminster was so great.

Other probabilities which may be ga by the comparison with Jumièges are tha aisles ran on past the transepts, and tha remaining parts of the north and south were vaulted at the same height as the The nave had large piers and columns nately following from the treatment a transepts. There was an important trif stage. The great lantern tower had two s above the roof. The existing pier bas Westminster are like bases at Jumièges some very early Norman capitals fron Dormitory windows (*c.* 1075) are also Jumièges type. In M. Roger Martin du book on Jumièges, the presbytery and tra are dated 1040–52, and the Nave 10 There is a late statement that the Con began his church in 1049, but this is dou I noted above that the master mason wa to be one Godwin Gretsyd. The late Dr. wrote to me in 1913 that "the Dean of has just found him and his wife Wende in the list of people to be prayed for in Abbey at Winchester." Only the othe Mr. Westlake told me he had found a ref to "Teinfrith mine Churchwright."

These both look like Saxon names, bu records are not contemporary documents I cannot think that any other than a N master could have built this great church fashion new to England. The material existing bases seems to be Caen stone.

ST. MARGARET'S.—Until recently it has generally accepted that this church clo the Abbey was founded by the Confesso has been urged, however, that such a dedi in the name of the Martyr of Antioch hardly be earlier than the second half twelfth century. But the claim for the found by the Confessor goes back to an early In Bentley's "Cartulary," among fourt century documents, I find the heading " foundation of the parish church of St. Mar Westminster, by S. Edward Confessor."

The similar dedication of a churc Rochester may be cited as evidence that i in use at an earlier time than is alleged. earliest mention of the church in the Roc records is found in a charter of Bishop Gu which may be assigned to the period 1107- The Bishop grants to the monks the altar of St. Nicholas [in the nave of the dral] the church of St. Margaret whi appendant thereto" (Mr. G. M. Live Parish Magazine). Then, further, we hav fact that an English princess, granddaugh Edmund Ironside, and a relation of Confessor, was named Margaret (afterwa become St. Margaret of Scotland).

*Mr. R. S. Loomis, in the latest examination of the evidence, concludes that the embroidery was English work prepared in time for the dedication of Bayeux Cathedral in 1077. "When it reached its destination it was found to be too long. The end shows no border corresponding to the beginning. The designer presents Edward enthroned in the first scene, Harold in the middle, and evidently intended to present William enthroned at the end. An embroidery which belonged to the Conqueror's daughter, Adele, must have been planned by the designer of the Bayeux hanging. Every scene is found also at Bayeux, except the last two. It follows that these two were in the Bayeux hanging before it was cut down." (American *Art B lletir*, Vol. VI, No. 1.)

RCHITECTURAL EDUCATION CONFERENCE

ARCHITECTURAL EDUCATION OF THE FUTURE

the third and last day of the Congress Mr. Gilbert (United States) presided. In his ng statement he said they were going to hat day with the architectural education e future, and called upon Mr. F. H. Bos- (America) to read the first paper.

AMERICA.

ling with the probable future trend of ectural education in America, Dean orth said, knowing the parentage it l not be impossible to foretell some of haracteristics of future architectural edu- . Changes in system would surely come. country and perhaps each part of each y would have some detail peculiar to In each, local conditions or local diffi- would require, as they required to-day, modifications, some adjustments, to fit ectural education into its place as a part general educational system.

its parents, the apprentice system was der, at the worst a penurious and can- ous old man, subject to no influences economic ones, which in the end caused ath of the whole guild system of which ntage was a part. Too often the pupil sciously set as his goal a faithful copy- the master. At its best it was the most is system of education evolved by man t it was the personal inspiration of the t by the master who taught untram- by any system, unhampered and free firing of growing imaginations by the f great example. When practice of this was teacher it was a greater influence ncentive towards high accomplishment heory ever could be, but being indivi- ic it had no continuity. What was good t of necessity perpetuate itself.

future's inheritance from the formalised g of the schools was perhaps less spec- , less obviously important. Theory t its worst sought for basic causes, was ted in the past and the principles which nt deduce from that past. That the de- ns were mistaken it was true, but the f research and analysis was recognised true foundation upon which to build. too, it had continuity, a life of its own ndent of the individuals who were s. Having continuity it was subject nences from without. It might change owly, but change it did in response to b and flow of students who sought for ace where education was most vital, and d that where the dry rot of academic held sway unchecked. Analysis and sis, creative faculty and critical faculty, eory and practice of architecture; the ust check the other. As in logic, is and synthesis were not, if properly tood, separate methods, only two neces- arts of the same method. Each was ative and corrective of the other.

e were the traits which they would hould be education's inheritance. From e the knowledge that no school could by system alone; that teaching in fact nly possible when it was learning, an t of the teacher but of the pupil; that and curricula were of use only so long served as the crucibles in which teach- as transmuted into the precious gold of g by the fire of imagination and enthu- kindled by contact with great per- y. The awakening of the imagination n act of the spirit rather than of the from theory, thoroughness, a respect entific research, and a scientific attitude towards the problems which the future architect must face. Their premises must be based upon knowledge, not sentiment, for sentimental conclusions had no more place in artistic work than in scientific; an inheritance from both, the best from each.

That it would be so was easy to believe. They had not changed so fundamentally since the days when men travelled to Thebes or Babylon, Athens or Alexandria, from one side of the world to the other, to find that man or that place where analysis and synthesis were but two parts of one process. That the schools had come to stay was sure, for they had a continuity and a responsiveness to the educational balance of trade which would act as an ever-present corrective—a corrective which could only exist where continuity existed. The shrinking world would make that international index even more delicate, even more quick to point a way from the western continent or the eastern, the southern hemisphere or the northern, as the one or the other lost touch with life, or enmeshed in the net of practical construction again mistook the means for the end. That corrective gauge would be not only an incentive to greater effort in the schools and country towards which it pointed, but by its very avoidance of another would spur that school and country to a higher standard. The schools of his own country owed much to France. They owed also much to the fact that once their own students deserted them. The compass needle pointed south as well as north.

They could not all be on an equality; but the day would surely come when practice aided by theory would cast off the bonds of form precedent and suck from the dry bones of the past the living principles which created those forms, and theory guided by practice would take on new life and vigour in its mission of analysis of present-day needs and methods. The present no less than the past had its fetishes, its useless inhibitions.

Diminishing distances would tend to make them more alike, each country to its neighbour, each school to its rival, not in its exact system of education nor in its details, but in understanding of the basic aims of architecture, in its appreciation of architecture as a great interpretive art, an intangible language speaking in terms of the culture of the south or the east, the north or the west, but understood by all men or all times as was the story told by the Acropolis of the glory that was Athens.

ENGLAND.

On the future of architectural education in England, Mr. H. V. Lanchester said in looking towards the future they should in architectural education take up the same attitude as they did in the political sciences, namely, that of developing from present systems towards something that would be superior to them. Evolution was orderly and natural. Revolution, though on rare occasions the only possible road, was always expensive and uneconomical of energy.

It was impossible to formulate a scheme that would be generally applicable when they took into account the marked variation in individual capacity of those desiring to enter their ranks. Education might proceed on either of two lines. It might direct itself towards the enhancement and expansion of individual characteristics, or towards concentration on the less developed ones in order to bring those up to a definite minimum standard. It was easy to see that the first was more in harmony with nature and the world spirit, the latter being merely a regrettable necessity imposed by the social organisation of the day. In many of the arts they were free to adopt the former, and it might be possible to conceive conditions in which architecture could come into line with them, but they were not the conditions obtaining at the present time. Therefore education must effect a compromise with its highest ideals, and the task was to devise the mode of doing it with the least possible damage to the more valuable side of their work.

He was convinced that an inflexible curriculum was a mistake, and that whatever the general lines adopted might be, they should be capable of very considerable modification to meet temperamental variations in the students in order to develop the best. They had seen the inadequacy of examinations as a test of artistic capacity, and the same reasoning applied to a fixed curriculum. Theoretically, all education in the arts was at any one period a matter between one master and one student, and they had to keep that door open to the maximum extent practicable. Then, again, they had the difficulty that many sought to become architects who were incapable of achieving their aims and secure a solid position in the profession through qualifications that were valuable in connection with building, but were unrelated to architecture. He would by no means deprive them of that position, but thought it devolved on the educational system to differentiate between such qualifications and the faculty for design.

To his mind the defects of the system at present in vogue were mainly due to the steam-roller labelled "curriculum," which aimed at turning out every student with a certain uniform acquirement; of course, it could not succeeed, but in its effort to roll everyone out to an ideal pattern, a good deal of harm was done. To begin with, it disguised inherent disqualifications and thus failed to eliminate the unfit at an early stage; furthermore, it militated against the development of individuality in type, assuming that four or five valuable years might be spent by every student in similar pursuits with equal profit. The whole tendency of the age was towards specialisation, and even a single profession such as their own had become too wide in its scope for most of them to master all its ramifications, but while he regarded the form of specialisation that confined them to certain types of building as vicious, he hailed as beneficial that which made the design and conduct of building operations a co-operative effort. Possibly the school could not be expected to anticipate such a practice, but he felt that at the end of the course a differentiation in qualification should be admissible, such as "honours" in some branches and "pass" in others, giving some indication of the graduate's special faculties.

It must be clear that in the case of anyone destined for an artistic occupation some indication of aptitude would be evident at quite an early age, say, between eight and twelve, and though it was usually undesirable that studies should take a technical direction before adolescence, faculties of all kinds, especially those of observation and deduction, now too generally permitted to lapse, should be judiciously developed from the time they first appeared. Public schools had been just as wide of the mark in failing to effect this as their own professional ones, with less excuse. Educationalists are beginning to recognise it, and he hoped to see one day young people on leaving school presented with a certificate reciting what types of occupation they were likely to be capable of. It seemed quite absurd that a youth should go to the age of sixteen or eighteen without having his thoughts turned in any particular direction and should then be pitchforked into this occupation or that on grounds that were often quite inadequate.

Taking architecture as the case in point, the school tests would be ability in drawing, including imaginative aptitude, together with the capacity for grasping the science of geometry, which was bound to connote a sufficient measure

of mathematical facility. Those qualifications, or their absence, were conclusive, and were, or should be, within the curriculum of every school. A student with those credentials was not running a great risk in taking up a course in architecture, but it had yet to be discovered whether his imagination was vigorous enough to survive the discipline demanded in the technique of the subject, which was a most searching test. Original work in ornament and decoration might be carried on side by side in order to provide comparative results; they would not militate against architectural proficiency if the latter could be attained, but might offer an alternative route to imaginative design should the trammels of construction prove too stringent for the expressive faculty.

On the other hand, should the logical and scientific attitude of mind take charge it should then be possible for the school to open a route in that direction and secure a high degree of efficiency without having to tack on to it a guarantee indicating a high grade in architecture. Possibly those would be the exceptions, and the majority, if accepted only on a certificate and with the proper adaptations in the course of study, would be able to justify the adoption of architecture as their work in life, though the more searching test would come later. Much could be learnt, but those whose work would live for all time were but few.

He would like to add a few words on the place of what was termed a "liberal education" in the making of an architect. The outlook on life that such an education gave made existence mean so much more that was well worth possessing, but in view of his claim that the education of the artist must begin with his earliest years, they would naturally scent a conflict between the continuity of this and the demands of the broader studies. This continuity must not be broken, and if the artist could not secure the broader outlook through the windows of his art, he could only afford to seek it during his life with the balance of energy allowed him by his proper occupation. After all, an art was itself in great measure a liberal education, and such an education was a lifelong affair more accessible by means of an open mind towards what had been and now was than by a term of years devoted to specific studies. True education was the development of faculty to the utmost, whatever that faculty be, and only by keeping that clearly before them could they attain to the greatest results.

FRANCE.

M. Leon Jaussely (Government Architect, Professor of the "Ecole Nationale Superieure des Beaux Arts," Paris) said whatever opinion they might hold of the present evolution of architecture, it was undeniable that the evolution did exist, and that they were witnessing at present conscious or unconscious attempts to renew architectural forms and æsthetics. This renewal was more particularly noticeable in large constructions: large stores, bridges, churches, banks, cinemas, railway stations, airship sheds, &c., which they could consider as the expression of the monumental architecture of their times, and which logically should be compared with that of other epochs in order to understand the meaning of this architectural transformation.

Iron and cement and their compound—reinforced concrete—had rendered possible, owing to their elasticity and greater strength, a constantly increasing development of what must be considered the most important characteristic of modern architecture; considerable increase in horizontal spans in contrast with the reduction of thickness of the vertical supporting pillars or piers, spiritualisation of forms by the maximum utilisation of the strength of the materials. The proportions were the reverse of the former proportions.

In modern architecture, architects in general had not regarded those chief materials as noble materials, and had exercised their ingenuity to hide them when it was a question of a really architectural work. The reinforced concrete was covered with mosaics (rational) or with stone or marble facings (irrational), so that in the latter case the facing thus produced frequently gave the building the appearance of precariousness which it had not got in reality, and of bad utilisation of the apparent building materials.

The new æsthetics derived from these materials were, therefore, indicated first of all by the reversal of proportions and stressed by pronounced contrast between vertical and horizontal lines without any softening of line and form, of transition or passage from one to another. The arch had been almost completely abandoned. It might be said that these æsthetics were rather crude, arbitrary, and intentionally unpleasing. Their influence had been felt also in the architectural æsthetics of the materials formerly used, such as stone, brick, wood; horizontal lines predominated, curves were more and more avoided; opposition between vertical and horizontal was universal.

These new æsthetics were further characterised by the simplification of the membering and its reduction to a small number of elements, the search for the enveloping form and general colour, in place of detailed moulding; the decorative points were elaborate, and even precious, but very sparsely distributed and stood out from a bare background; the appreciation of volumes and masses was exact, the outlines were severe—the sobriety of these æsthetics excluded all mannerism. A new direction seemed to have been struck which could only become still more pronounced. It was a pity that constructive frankness of form is reserved chiefly to the interior parts, and that external decoration of the façades mostly did not correspond to it.

Did that new orientation demand a new teaching of architecture? It seemed that it must be so. The problems which the architect was more and more called upon to face were constructive problems of always increasing audacity, difficulty and complexity. This must lead the architect to become more and more a constructor, not in the narrow professional sense, but in the highest sense, bearing in mind that the architect must be in a position to solve architecturally any exceptional and most important constructive problems that may occur.

He could no longer be simply an artist who, as was the case still to-day, conceived merely the decoration, the clothing of the forms supplied to him by the calculations of the engineers; he must himself imagine the forms in their complete logic and rationality, construction and decoration being the product of one and the same brain. It seemed that was the capital point of the future teaching of architecture.

The beginners should be taught besides, at the very commencement of the study of architecture, to consider all the forms of the history of architecture of the great periods, Classical or Gothic, as chiefly constructive forms—which they were—and shown that the decoration merely brought them out, and that instead of covering everything the decoration was sparsely and very judiciously distributed to suit the constructive form. That was the great lesson taught by the fine periods of architecture. The evolution and the progress of architecture were in the fusion of the two spirits at present sharply distinct; the constructive spirit and the decorative spirit. Seen from that higher point of view, the teaching of the construction, that of the history of architecture and of the theory of architecture became capital points. From the first, all teaching must be directed by a study of the rationality of the forms of the past and a logical conception of modern forms.

Another important point of view in teaching was that of the conception of the building or of the construction considered as being situated in a generally harmonising environment. In teaching, attention had been chiefly given to the æsthetics of the work itself, but the pupils should be shown the value of the general harmony—natural or human—in which the buildings were to be erected, and the necessity of adapting the work to be built so as to ensure that harmony. In that sense, and wit insisting on the importance of the teachir "urbanism" from its purely technical practical points of view, the teaching o history of architectural urbanism was of highest importance and should not be negle but should form part of the general tea of architecture.

ITALY.

Mr. Gustavo Giovannoni also read a pap "Architectural Education in Italy in Future."

Italy, he said, was proceeding to carry a conception similar to that followed by F when it founded about twenty years ag Regional Schools by the side of the old Centrale d'Architecture in Paris. Whilst serving organic unity of the type of instru in such schools, it seemed advisable to in them a certain variety in the direction o both as regarded the study of the sul (different in a centre of industry and in a of monuments), and the study and inspir of the regional forms.

In Italy, in effect, in spite of a single ment having endured through different s in spite of the prevalence later of that which, from the sixteenth century to our t had become, with progressive transform a universal style in the monumental archite and partly also in the modest private arc ture, there had always remained in al regions a special character which, by degrees, passed from one centre to an It was just in this variety which logicall ponded to the various conditions of enviro and was expressed in so many noble monun that was to be found one of its most inter architectural characteristics. Also in therefore, the new architecture should accordance with the Italian formula of " vation in the tradition," and the local sent should be a substratum for new manifesta

In that way would be avoided illogical position of types and forms from one pl another, which transpositions represente negation of the sound conception of "en ment," that was to say, of the accord be the sentiments and the proportions of th architecturally perpetuated and the p In every centre with traditions of art the could begin with the survey and exact standing of the local monuments—not o the noblest, but specially of the humble in which the ethnical character lived to a g extent and the permanent elements found a and direct expression. When this idea be supported by positive knowledge, the g on the old trunk of new plans and new responding to the new conditions woul place automatically and naturally by r solutions, but harmonising with the e ment, which, in Italy, was an extrinsic e dominating the intrinsic element.

The following are further abstracts fr Gustave Giovannoni's paper on "Archit Education in the Present in Italy," sor of which was given in our last issue.

As regarded the artistic direction a method by which were incorporated int conditions of modern problems and pla those of the tradition, the principle f was as follows. In the beginning the was based on the one hand on classical for their laws, so as to mould the mind of the man into an architectural humanism sin that which the study of Latin produce general culture; on the other hand, on plans or schemes without that exagg either of the synthetic volumetric stud excessive care for the style. In that research very useful methods were to b in the manifestations of the spontane picturesque architecture of country hou the more highly developed and elaborat festations of the so-called minor arch which lived in the modest city houses gratings, small churches—which beauti streets by small local touches and solv natural manner so many problems troubled modern architecture.

sition in various styles of the past was carried out as a direct exercise of the architectural styles and of history of ure side by side with the sketching in book and making plans of monuments lying their restoration. These com- in style dealt, however, with genuine such as those of an old edifice with its nation and in its proper environment (a ouse in Ostia, a Gothic church in Siena, enth century palace in Naples, &c.), side the application of styles to modern

intended in that way to prevent from false ideas of style not based on any reason from getting hold of the mind of the young, which must be formed by essive exercises, with a relative freedom as controlled merely by the initial education and discreetly guided by the f the teacher. In the same way as difices had developed or were developing hitectural environment with a free and rmony, the single individualities must is instructional environment means of without being oppressed, having in merely the general ideas, the sentiment, age of architectural inheritance. And od began, in fact, to bear good fruit.

High School of Architecture in Rome s a special course for the study of nts which now began to function as a f the school itself. The object of this ourse was to develop analytical study y, technique, and art of monuments, of restoring them, and archæological pertaining to architecture; it was to become a centre of culture where would meet archæologists and s of art, to constitute, so to say, a for research in assistance to the roblem of restoration of ancient monu- d excavations, and to prepare in that lified technical and artistic staff to e State could entrust the task of pre- ne nation's capital. Its foundation had the transfer to architects of the study of the monuments, which was now y in the hands of other people who he necessary technical and artistic ion.

mber of students in the school of Rome d this year to about 150, and in the tural Section of the Polytechnic of about 60. These figures were still very mpared with the thousands of civil various schools of engineering and in nics in Italy who were sufficiently if not repared in the studies of architecture entitled by their leaving certificate to it. But it should not be forgotten that period of new foundation and of intro- of new ideas. The principle having n firmly established that the art and the n of a modern architect must be distinct ose of an engineer (contrary to the of studies which was more deeply n Italy than elsewhere), architectural taken in itself was found to progress and to reach the goal of preparing not xceptional architects made to raise and grandiose buildings, but a large of professional architects capable of with every concrete problem of When that reform came to maturity be possible to introduce a sharper sub- in the professional practice between s and civil engineers, who now worked me field.

necessary to make a brief mention of utions which completed the culture of after they obtained their leaving es, and gave artistic direction and finish ung. The national artistic foundation ecture, an institution somewhat similar f the Prix de Rome in France, was of nportance than competitions open to g; it was offered by the State every and lasted for two years. Numerous d private foundations enabled young who distinguished themselves to emselves to study before starting pro- work.

The competitions for young members instituted by the "Associazione Artistica fra i cultori d'Architettura" in Rome, a corporation which had for its object artistic and general culture, had lately acquired great importance as an adjunct to the official course of training. The subjects of these competitions were very modest and practical, such as projects of groups of small dwelling houses, of small country churches, of special building arrangements, &c., in which the young purified their strong sentiment for art, keeping far from the empty academy, the place of which in the modern nervous life became of secondary importance. By the side of those competitions a series of lectures, debates, visits to monuments or to works in course of construction, completed the education of young architects, brought them in contact with their maturer colleagues, and allowed that fusion between tradition and innovation which in Italy was necessary since it had to harmonise with the permanent and continuous character of its architectural manifestations.

The results were very satisfactory and promising. All the energies of the new generation converged now in the effort in a single direction. The dead centre had been passed, and the young saved Italian architecture and restored it to its nobility. The fifty years of aberration in the teaching of architecture, now surmounted, had not in fact left unaffected the average architectural works, though, of course, that does not imply depreciation of some monuments of high importance such as the Monument to Victor Emanuel, the Palace of Justice in Rome, &c., that had been produced in that period. Unsuitable and irrational imitations of styles vulgarised by speculation had too frequently alternated with the application of exotic fashions without the architects remembering that national style in architecture was a positive reason rather than sentiment, and that ephemeral caprice was inadmissable in permanent manifestations such as architecture which was settled by extrinsic rather than by intrinsic conditions.

Discussion.

Professor C. H. Reilly said looking at their English towns, what did the nineteenth century schools give them? They gave egotism and rank individualism. In place of the urbanity and continuity of the eighteenth century they had the riot of free architecture which produced towns like Wigan and Bolton in the North and thoroughfares like Oxford-street and Fleet-street in London. It was because the individualists of the nineteenth century broke through all the rules and restraints that had grown up through centuries that to-day they had nearly all their buildings overloaded with unnecessary features and ornaments. Modern French and American buildings were clean and restful structures in comparison. The great achievement of American building was that the general level of the worst buildings had been raised. Only the co-operative spirit, the sense of responsibility to the community, could successfully combat individualism and restore again something like order and decency to their towns. This was the chief problem of the future and the solution of it was the chief contribution the schools of architecture could make. If they solved it, it would be because they had learnt from France the right method of approach to a problem and the value of a logical solution.

By accepting French logic they learnt to build with restraint and dignity, but they had a long way to go before they reached American standards. In American schools they had 5,000 students; in England they should have, not 686 students, but 2,000. If English offices could reproduce the spirit of comradeship the schools possessed, students would not be so depressed on entering them. Mr. Waterhouse had mentioned the spirit of the offices in the eighteenth century; if only it were as general to-day they might hear less of the divine inspiration of the great architect, but they would have a prouder and better spirit of work. Enthusiasm was too valuable to be lost in offices run like factories. It was important that programmes should be set that called for simple, monumental solutions. If they did big things simply and directly they would do little things with distinction. It was not possible to enlarge a cottage into a palace. There were two schools of architecture in England at present: one derived from the association of the domestic hearth, and the other from the Roman Forum. He, Professor Reilly, would choose the latter.

Mr. Howard Robertson said he entirely agreed with Professor Reilly with regard to his defence of the schools in respect of generally raising the standard of architecture. They did not want young men not fitted for architecture, and self-respecting schools rejected them. The trouble seemed to be to decide what constituted an architect; there were many differences of opinion as to his function. The opinion had been expressed that his function was knowing everything about the feel of materials. Then there was the business man in architecture who got jobs and hired them out; they were better without him. Then there was the type mentioned by M. Jaussely; a big man who was not worried by details of construction, but was concerned with the big problem of handling form with the materials and construction available. Lastly he would include the ordinary small man in practice who had a feeling for craftsmanship. All those people came into the schools to be trained. The only conclusion they could come to was that they had different types and could not make the curriculum too inflexible. It was questionable whether five years was such a long period that a man could not go through it without having individualism crushed.

The following letter from Professor Lethaby was then read:—

Architecture: Design, Education.

"The problem, what is the right kind of education in design for architecture is difficult to discuss, for the words are so variously understood in different minds that they stand for three unknown—or at least, ill defined—quantities: architecture, design, and education. Two or three years ago I tried to draw up a short statement of what I thought might best be meant, and when it was shown to an able man he seems to have been quite interested, for he remarked, 'It expresses exactly what I don't mean.' The subject is generally discussed as if it involved deep metaphysical questions to be argued over like a theology, and the amendment of educational processes is likely to be as difficult as to reform the Book of Common Prayer.

"What I think should be meant by the words must be plainly said at once. By 'architecture' we should understand the whole building work of a time or country; by 'design,' arranging how this work should be done; and by 'education,' training in the same.

"On the very first point, that 'architecture' must mean the whole of building work (I must not say art here, for that word is another nest of ambiguities), it will be said that most of this work is obviously unworthy. Just so! it is unworthy architecture! It is impossible to draw any line giving architecture a superior status to building that does not result in defining it in such a way as may leave some of the best and most beautiful buildings in the non-architectural class, while retaining some of the most dreadful ones within the fold. Secondly, it is thus we use the word in regard to the building arts of past times. Thirdly, it is only by bettering the whole body of building that we shall be able to raise the summit. Fourthly, to seek to improve the whole custom of building in a country seems to be the only motive big enough to worry about.

"By design I mean the reasonable for seeing how sound work shall be done. Design in the modern sense of contriving striking 'effect' was unknown in ancient art. Custom was then the designer, requirement was the definer. Design as *design* is a modern disease. We have to get rid of 'design' in the discovery of the inevitable. It appears to students that to be a competent architectural designer is to be a master joker in whim-works. I must say that it is as silly to design modern buildings in the styles of school competitions as it would be to

design ships and engines in anxiety about massing, composition, lines, proportion, and all that. The truth is that engines and ships, having reality and being organic structures, have form and style, too; whereas the compositions in 'looking so' have only the style of a style.

"By education we must mean the best possible training in a sound knowledge of fine procedure in building. It is not necessarily attendance for many years at a school. Schools may doubtless teach many things, like planning, geometry, mathematics and drawing, but school education must be supplemented by direct contact with hard material and real problems. Even in what is done in the schools, it should be reconsidered whether they are done in the best way. Drawing itself, if I may venture to say so, is in danger of being thought of as a way of preparing fascinating winners in competitions, not as the best way of representation. Fine and sincere drawing is undoubtedly a personal discipline, little as it has to do with the hard realities of building. To the young student, I should like to say—so far as you are permitted—put structure in the place of style; put craftsmanship in the place of draughtsmanship; and put science in the place of archæology.

"Old building art was essentially different from ours. It was folk custom freely interpreted by little masters who were of the same class as the executants, and it was done for local understanding in local ways. It was often small and shy, yet always showed the human soul. Its essence was craftsmanship. Modern building in cities has to be planned by experts trained in universal science who order from a distance executants with whom they have little direct contact. Its type is engineering.

"One was intuitional and immediate, the other is intellectual and international. All attempts to make modern highly organised building resemble the old free craftsmanship are foredoomed to failure; we are fighting against the essence of the thing instead of seizing that of making the best of it. Although it may be anxiously provided that there shall be none but handwork, the result is all the more subject to the machinery of plans, specifications and contracts, and you reach less freedom rather than more.

"In country building it might to some extent still be different if we approached this work from the end of craftsmanship, local custom and materials. There might well be a difference between city and country buildings, and the kind of people who undertake them. Always, too, all decorative matters should be the contribution of independent artists. Decoration is of the nature of poetry, and machine-made poetry is really an unnecessary mistake.

"Although a great gulf is fixed between the past of architecture and ourselves, all frantic efforts to form any new and original style are misguided and the results seem to me worse than the dead style stuff to which we are accustomed. You cannot make originality, you must find it. True style is not a whim, it is the expression of that which is within.

"As I see the problem there are two great ambitions open before us: To be better builders and better structural engineers. There are two main approaches: (1) From the side of workmanship, the knowledge of materials and methods; (2) from the side of science, mathematics and books. These two paths, however, must be drawn together; the scientific man should go through as much shop drill as possible, and the practical craftsman must have book knowledge, too. Art and science have to be re-intergraded. I should like co-education with builders and engineers.

"The 'styles' should not so much as be mentioned among you. There is something shameful about talk of such vain superstitions which, in fact, stand in the way of our working towards true style. We have too long tried to impose 'styles' from outside, whereas true style and vital forms are always the results of growth from within. In the place of style dreaming we must put the idea of structure life, energy, activity.

"By structure, I mean something quite different from what is ordinarily meant by construction, the safe putting together of a style-design. What should be understood is an organic principle directed towards the perfecting of building types, including skilful planning, suitable selection of materials, adequate lighting, warming, roofing, efficiency, endurance, economy, I mean a sort of building crystallisation, the entering on a line of development like those which have produced the ocean liner, the engine, and the aeroplane.

"It is a big matter which requires a great effort, and I wish I could suggest a motive strong enough to be a counter-attraction to the distinctions and prizes that are to be won by designing draughtsmanship 'architecture' in the air. All I can point to is the reason of the thing and the public service the architect who can improve ordinary buildings—for example, the small dwelling house—will be a benefactor to his country. Moreover, the nation which develops a school of structural architecture will necessarily lead the others. We shall have to copy wisdom if we cannot discover it for ourselves. If we won't look forward we shall have to 'look out.'"

Mr. W. W. Scott-Moncrieff said in the matter of architecture all nations should have their own individuality, and, for this reason, he made an appeal to his own country to strike out a line in architectural education and stick to it. The system that might be right for France or America might not necessarily be right for England.

Mr. C. R. Ashbee said with regard to architectural education of the future, they must include social as well as technical education. There were five points which were not sufficiently considered. First, the architect and the profession generally must get to know the workman—what he stood for and what he did not; and what was the cause of the chronic discord between masters and men? Second, in architectural education of the future the question must be studied as to what was right or wrong, logical or illogical, with regard to machinery. They had so far regarded it empirically. Third, the architectural schools had come to stay, but it was necessary to remind themselves that schools must always remain imperfect instruments of architectural education, and that they still continued to be divorced from life. The craft and technical vocations could only be learnt in the workshops of those who were practising for a livelihood. Therefore, they should distrust schools, particularly technical schools. Much of the finest building, old and modern, had been done by men who could not, in the accepted sense of the word, draw properly. Fourth, the architectural education of the future must give heed to the humanities. Lastly, when attempting to solve some of those problems, they must not forget how much damage had been done by the war. The architectural education of the future would have to take the thread up from where it was dropped in 1914.

MM. Carl Brummer, Jean Hébrard, A. Defrasse took part in the discussion.

Professor Beresford Pite said he would like to draw attention to two matters. First, the important move which had recently taken place in the recognition by Cambridge University of the importance of architectural study, and the admission of architectural studies into the curriculum of the University. The great need of architectural education in the future was not students, but teachers inspired with wide ideals which far exceeded the requirements of a curriculum. Teachers who could create schools, and whose personal influence would replace the loss that architecture was sustaining through the lack of individual masters. The other point he wished to emphasise was the very interesting letter from Professor Lethaby and the important speech of Mr. Ashbee. For some time now, about two years, a group of architects had been meeting in London to consider the possibilities of an ideal for architectural education.

After M. Horta, M. Victor, Mr. Foster King, and M. Vladimir Jezek had taken part in the debate, the Chairman closed the discussion.

THE BANQUET.

A banquet in connection with the C was held at the Hotel Victoria, Charing on Thursday evening. The President Royal Institute (Mr. J. A. Gotch) occup chair, and amongst those present wer Crawford and Balcarres, Sir Reginald Bl Sir John Burnet, Sir G. Gilbert Scott, S Simpson, Sir Cecil Harcourt Smith, Si Sulman, Sir A. Brumwell Thomas, Sir Walston, Sir Lawrence Weaver, and Me D. Adshead, A. Annoni, T. P. Benn Bèrard, C. Boni, W. A. Boring, Carl Br L. B. Budden, H. P. Cart de Lafontaine Cordonnier, H. O. Confiato, H. C. Corle E. V. Crompton, P. D'Achiardi, A. J. E. Guy Dawber, A. Defrasse, Rudolf Franz Drobny, W. Emerson, H. M. F Cass Gilbert, Charles Girault, H. S. G Rendel, W. Curtis Green, Stanley Ham Hebrard, M. L. Jaussely, Gilbert Arthur Keen, Erik Lallerstedt, H. V. Lan A. Louvet, Ian MacAlister, Mervyn Ma A. R. Mercato, M. O. Monasterio, Monson, W. G. Newton, R. Ostberg, E. ridge, A. Beresford Pite, W. S. Purcho Reilly, Howard Robertson, D. F. Slot M. J. H. Somakeo, Arthur Stratton Sullivan, R. Unwin, C. F. A. Voysey Warren, Paul Waterhouse, Maurice C. J. H. Worthington.

Proposing the toast of "The Pro Architectural Education," MR. GOTCH thought they would all agree that archi education was now so firmly established to the progress which had been made recent years, that its continued progres future might be taken for granted, a might drink the toast with a light he success depended in a large measure teachers, and to them and to the P Architectural Education they owed a d of gratitude. He was happy to believe teachers took a wide view of their resp ties, for education was not merely the ir or acquiring of knowledge but the pr sharpening the faculties and of de innate powers to put to good use the kn which was acquired. He had little do architectural students avoided the d becoming too learned, of being too th armed against the forces of ignorance an petence, and thereby rendering themselv to share the fate of the unlucky kni was smothered in his own armour. same time, in architecture as in anyth a little learning was a dangerous thin students had their own interests at he would quaff deep the draughts which out to them by the architectural school architectural students in other counti working to some purpose was manifest splendid exhibition of their work at G House, which had been one of the features of the Conference, and that t supported by their distinguished co was evident from the welcome prese many eminent architects from overseas attended the Conference in most circumstances, which promoted the all nations could be as closely united in they were in art. He coupled with the names of three of those eminent r Girault, whose singular genius had alre recognised by the Institute by the awa Royal Gold Medal; Mr. Cass Gilbert, most distinguished architects of Ame was showing a lead in modern archit such brilliant examples as the W Building; and Mr. Ostberg, of Swed splendid design for the new Town Hall holm had been exhibited at the Inst had filled them with deep and genu ration.

Messrs. Charles Girault, Cass Gi Ragner Ostberg responded.

MONSIEUR GIRAULT expressed, on the architects of France, their great p having had an opportunity of atte Congress. He would assure them had taken a very great interest in the e views on education which had been in the discussions, of which they wou

ge. If the different groups of people reason of their different countries, their customs, their social state, adopted methods of practising the art of archi- t did not matter so long as the great s of the art could be made to serve as of study for the architecture of the in which the architect practised. An miration should be reserved for me- rchitecture and for the beautiful archi- f ancient times. In considering the to be used in building, they should account the climate, the ways of the nd the temperament of the people, logically the problems which had ut the ages confronted mankind. to transport the methods of one into another without knowing the s and customs of the country in which od of building originated was illogical, not the way in which would be pro- uilding which would be the admiration who beheld it. When, in order to recordance of civilisation; it was, in fact, the recordance of life itself. It was always of its own time. It might sometimes try to imitate, but it could not do so successfully because the conditions were always different with each age. Architecture reflected the conditions and civilisation of the age in which it existed. Whatever was taught in the present, the architects of the future would, consciously or unconsciously, record indelibly the civilisation of the age in which they lived. It was said of Solomon that he was the wisest of men because he was the most learned; therefore, teach wisdom, teach understanding of the spirit of things, of the spirit of the age. It was the spirit they should teach—let imagination run, for the trained mind would cover an active imagination and make it more useful for the present and more valuable for the future. It was up to the architects of the present to keep burning the torch of yesterday, and pass it on to the eager age of to-morrow. He and the other delegates all felt grateful for the opportunity of attending

The Cover of the Congress Banquet Menu.

their young architects, they placed eir eyes the best examples of the past, t to incite them servilely to copy those , but that they might apply themselves ining of a knowledge of how the great of the art of building had gone about rk. Past generations had left im- e monuments which were witnesses ability in the art of architecture and so were records of the customs and nd religion of their times. Architects resent should not confine themselves ng monuments to meet the popular but should in every case satisfy them- at the laws of hygiene were followed the buildings would be healthy and habitations. More than ever the study ecture should concentrate on the study houses. Perhaps it was hardly neces- mphasise this to their English *confreres* given them a lead in the design of class dwellings, for it was with un- dmiration that the foreign delegates the housing schemes in this country.

ASS GILBERT said architecture was the Conference, and would carry the memory of it as another event in the history of the Royal Institute of British Architects.

MR. OSTBERG said Swedish architects had the habit of cultivating in their northern country the architecture of the Greeks 2,000 years ago, and that could be seen reflected in their modern buildings.

MR. PAUL WATERHOUSE, proposing "Our Guests, Foreign Countries, and the Dominions of the British Empire," said when it was remembered that the Congress represented no less than seventeen Dominions and foreign countries, they would realise what a big task he had been set in proposing their health. At the conclusion of a witty speech, in which he addressed the foreign delegates in French and introduced some couplets suitable to the occasion, he said it was in no artificial parlance of the dining-room, but with a very feeling heart, in which all his English friends joined, that he asked the Englishmen present to drink the toast.

MR. H. K. STABELL, in responding, said on behalf of the nations invited to the Congress, he expressed their most hearty thanks for the hospitality they had received and the ideas they had gained on architectural education. The Congress had been very successful, both on account of the very interesting lectures they had heard and the opportunity it had afforded of discussing the subject. The representatives of the different nations would go home and discuss the different ideas they had learned, which he felt sure would be reflected in methods of architectural education in the near future.

SIR GEORGE SULMAN said as an Anglo-Australian, he need hardly assure them of the loyalty of the Dominions—that was proved in the late war—but he would assure them of the loyalty of architects in Australia to the Royal Institute, whose footsteps they endeavoured to follow. They might have some slight differences in method, and perhaps they occasionally made a forward step on their own account as, for instance, the obtaining of registration a year or two ago by the Institute of Architects of New South Wales. He felt sure members of the R.I.B.A. could rejoice in the activities of their Australian brethren. The Conference had been most valuable, and he would take back to Australia many ideas, and hoped to have opportunities of spreading the knowledge of what was being done in this country. In Australia architectural education had not developed as it had in this country; there were only one or two schools, but they would grow. He had been struck in listening to the discussions by the fact that although they differed in matters of detail they were all anxious for the well-being of their profession, for its greater influence in the world, and especially for the benefit of the generation which would take their place in the world. In conclusion, he expressed the opinion that before long, with the development of wireless telephony, it might be possible for the Royal Institute to have for its President a representative from one of the Dominions.

PROFESSOR WELLESLEY MCCONNELL also responded, and expressed his appreciation of the hospitality the delegates had received.

VISIT TO GREENWICH.

The visit to Greenwich on Friday by launch was a great success. Weather conditions again appeared somewhat unsettled, but the delightful greys and opalescent tints of the immobile clouds stirred our foreign visitors to enthusiasm and one heard on all sides such comments as "*C'est épatant ces tous gris!*" "*C'est ravissante cette brume!*" At our departure, the tide was at its highest point and the wavelets and eddies caught in infinite variety the tones of blue and grey, the mellow shafts of golden light which now and again illuminated the passing panorama of the bridges, warehouses, wharves, and other buildings on either bank; while the graceful silhouette of the spires of the City churches and the dome of St. Paul's completed a picture of enchantment.

Chief among those whose duty and pleasure it was to describe this panorama of architectural achievement and historic interest was Mr. John Burns, who must have created a record with a continuous flow of descriptive and informed comment from Lambeth to Greenwich. This, however, by no means exhausted our Honorary Fellow's fund of information, as he repeated the performance on the return journey.

On arrival at Greenwich, our launch made a wide circuit of the river and thus enabled us to get an excellent view of the famous Hospital and the Queen's house beyond, with the fantastic outline of the Observatory on the skyline behind. After a welcome tea at "The Ship" Hotel, the delegates were shown over the Hospital by Mr. T. C. Agutter, architect to the Royal Naval College, who explained the manner in which the buildings had been constructed and how the necessity of providing access from the Queen's House—then a Royal residence—had resulted in the open plan with two blocks of buildings on each side of the central avenue. Of these, the block on the west side is the earlier and is supposed to have been carried out

by Webb. Sir Christopher Wren subsequently made additions to this block and planned the block to the east of the main avenue, together with the two colonnades which form a distinctive feature in the whole scheme, with the Chapel on the east and the famous Painted Hall on the west. This latter particularly interested our foreign colleagues, both on account of its admirable proportions and for the magnificence of the scheme of decoration. A brief visit was paid to the Queen's House, designed by Inigo Jones, forming the central feature at the end of the central avenue with two wings of later date on each side. The central hall was admired and its excellent proportions commented on, as were also the fine ceiling and curious mosaic floor.

The return journey proved even more agreeable than the outward trip, as the sun had, to a great extent, dispersed the clouds, which were massed in towering beauty behind the towers and spires of Westminster.

VISIT TO CAMBRIDGE.

The all-day excursion to Cambridge arranged for the penultimate day of the Congress proved to be a great success; in fact, several delegates from distant lands expressed the opinion that it would have been worth coming to England for this excursion alone, as few of them had any idea of the distinctive charm which is so marked a feature of each of the two great Universities.

The arrangements for the visit (as indeed for all the excursions and visits which took place during the Congress week) were well thought out and worked smoothly, thanks in great measure to that indefatigable secretary, Mr. Everard Haynes, who was ably assisted by the small band of stewards and interpreters. Their success received the best of all tributes—the lack of any comment. The party assembled at the Great Gate of Trinity—surely one of the finest gateways in England—and after a concise summary of the distinctive functions of the University and the Colleges by Mr. H. M. Fletcher, proceeded to the Chapel and Hall, admired the great Quad., and passed on through Trinity to the famous "Backs," with their picturesque charm and wonderful lawns. The latter, as always, were a source of astonishment to our foreign friends. A rapid visit was paid to St. John's, where the "Combination Room," a delightful example of the domestic architecture of the period, with its old panelling and fine modelled plaster ceiling. From St. John's we made our way to Caius and Gonville, where the party was entertained to lunch in the Hall. At the conclusion of our repast Mr. Dawber proposed a vote of thanks to the University authorities in a few graceful and well-chosen words. The Vice-Chancellor, in his reply, referred to the importance of architectural surroundings as an adjunct to the culture which it was the mission of their university to impart and expressed the pleasure which they had in receiving the delegates to this important conference.

After lunch a visit was paid to Magdalen College and the Pepysian Library was inspected before we proceeded by private motor bus to the new buildings of Clare, designed by Sir Gilbert Scott, R.A. Here we were met by the architect, who briefly explained the building. This is rather a departure from the usual type of college building, of singularly happy proportions, treated in grey brick with stone dressings and a red tile roof. In the centre is a memorial gateway of characteristic design. The old buildings of Clare were next visited, and we then proceeded to King's, and inspected King's College Chapel under the guidance of Dr. Cranage. From here rapid visits were made to St. Catherine's, Queen's, Pembroke, and Emmanuel before returning to town. As before, part of the party returned by car and the remainder proceeded to London by train. The car section further divided *en route* as some of the party made a halt at Hertford for dinner, and at the conclusion of this repast Professor Boring made a charming impromptu speech, in which he expressed the thanks of the foreign delegates for the kind way in which they had been received.

ARCHITECTS' AND BUILDERS' INQUIRY BUREAU

**** ***We are glad to give questions and answers but cannot accept responsibility for contributed replies, especially on legal matters.***

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or better still, in typescript?—ED.

[Reply to "PERPLEXED."]

SIR,—I am not quite clear as to the nature of the contract between your correspondent and the person he refers to as the "purchaser." It almost appears as if the latter was only an intending purchaser, in which case there is considerable difficulty, as the subsidy is payable to the person erecting the necessary type of house and application is not accepted in respect of houses that have been already erected, which precludes a fresh application on another's behalf.

If, however, the terms of the contract permit of the "purchaser" establishing this title to the house, and his withdrawal can be made to take the form of a re-sale to the contractor or to another purchaser, then the original applicant for subsidy is entitled to claim the same although the property has passed out of his hands, that is, of course, provided the local conditions as to occupancy within a certain period from completion have been complied with. He thus becomes the person who has erected the house. It would, therefore, be well to consult a solicitor with the object of putting the transactions into correct form, and I do not think there should be much difficulty in so doing.

In future transactions of a like character, where your correspondent erects houses with a view to sale on completion, it would be well if he applied for subsidy in his own name, and he could then claim the grant when the house became occupied. "X.X.X."

Corrugated Iron.

SIR,—Considerable trouble is experienced on the underside of roof and inside walls of a large works covered with corrugated iron. This was painted about two years ago with oxide of red paint, which is now coming off in flakes and powder. The difficulty we are contending with is that *rust* comes off the corrugated iron sheets in the form of dust and settles on our stock, which causes stains. There is water used in our works and it causes a lot of damp vapour. Would some reader give remedy?

"Z."

[Reply to Mr. THOMAS TILE.]

Drainage.

SIR,—The open manhole cover as a fresh-air inlet is always objectionable in the vicinity of a dwelling-house, and would be rightly condemned by a surveyor, though he will doubtless require it to be replaced by a proper mica-flap F.A.I.

The present position of the interceptor will not prevent back flooding and the required position will make no difference in this respect, though it rightly throws a long length of drain into the ventilated section.

Water-tight cess-pools will always overflow in time if no provision is made for the disposal of the contents. Most rural authorities undertake the periodical emptying of cess-pools, but where this is not so, the objectionable operation may be avoided by the adoption of a septic tank system, the effluent from which is almost pure and can be allowed to soak away through a filter bed of destructor clinkers. The requirements are that the septic tank must be absolutely air- and light-proof, and the inlet and outlet pipes must dip well below the liquid surface, to allow the scum to form and develop undisturbed.

"SANITARY."

Cement and Other Foundations.

SIR,—I have recently had to put in fou tions to carry a stone for a memorial weig about four tons. The work is under the s vision of a well-known archæologist, who w to me as follows:—"Cement is quite an unk quantity as regards its durability over a period and should therefore not be used. only thing to do is to carry to the spot flin small stones, a certain amount of fragmen brick and sand, also unslaked lime. The should be well mixed up and then (and before) water should be poured on and being thoroughly mixed should be used wi delay. This is the only way and will set so that it will be just as good in a thousand as it will be in a few months' time." I sh be glad to know if the above statement justified by facts.

"CLERK OF WORK

Floor Treatment.

SIR,—What is the best treatment for sound oak floors in a club? We do not wi stain the boards or varnish them, but to something which will bring out the grain put "life" into the boards.

"J.

Leaking Walls.

SIR,—A house built about five years ago 14-in. walls in cement and rendered outsi cement left from the float, persistently le water through. No settlement cracks noticeable, but pronounced crazing has place in some of the outside rendering an damp patches inside are most noticeable this occurs. The walls are cream distem outside.

Can anyone suggest a cure for this troub

"ARCHITEC

Provisional or Copy Amounts.

[Reply to "ARCHITECTUS."]

SIR,—Provided the architect takes ca word his orders for goods from sub-contr appointed by him so that they clearly re orders for the general contractor to ord goods from the firm concerned, his fin responsibility therefrom begins and ends he has duly certified for payment, an sub-contractor has no financial claim upo except in cases where a certificate has withheld without justification. The pr should be made clear to the sub-contr when they are advised of the issue of an to the general contractor. There is a deal of laxity in these matters, and architects order in their own names and accounts to certify when rendered dir them. This is a very irregular and unbus like practice, and architects have been responsible for payment in some such where the general contractors have fail

"X.

London Housing.

Up to the end of March the L.C.C.'s capital expenditure in respect of housin £15,499,566. Their pre-war housing oper as a whole (apart from the cost of cle schemes, &c.) have resulted in a surp £106,984.

For the current financial year the total sums to be voted on capital account is £1,9 in addition to which £1,580,000 is in under the heading of provisional sums to expenditure on purposes not yet spec approved by the Council. Of the amo £1,909,900 now to be voted, £1,169,040 to such development of the Becontre Downham estates as has been approved Council. A sum of £50,000 is provided fo sum grants under the Act of 1923 in of houses erected by private enterprise. the Armistice the number of hous tenements completed is 8,570, and of th houses and tenements under construc large number are nearing completion.

THE WEEK IN PARLIAMENT

WESTMINSTER, *Wednesday.*

Building Materials Bill.

Prime Minister informed Sir K. Wood e Building Materials (Charges and Supply) ould be one of the first measures that the ment would invite the House to con- n its reassembly in the autumn.

Bricklayers' Labourers.

K. Wood asked the Minister of Health r he could state the arrangements he ade concerning the facilities to be given y bricklayers' labourers might rapidly e fully-fledged craftsmen ?

Wheatley said the National House g Committee on which both employers eratives were represented, proposed in eport to give special consideration in the pment of their apprenticeship scheme to nts such as building trade labourers d had previous experience of the building

Returned Emigrant Bricklayers.

K. Wood asked the Minister of Health r he could now make a statement as arrangements he had made with the ional authorities for the training of tice bricklayers; whether the period of ticeship would be thereby curtailed; and r he could give any estimate of the r of returned emigrants that might be d to return to the building industry the next twelve months ?

Wheatley said he was not yet in a position e a statement as to arrangements with onal authorities. It was obviously im- e to frame any estimate of the number grants likely to return within the next months.

A Guaranteed Week.

Wheatley informed Lord H. Cavendish- ck that the question of the adoption of anteed week was one for settlement by lustry itself. He understood, however, efore the present dispute arrangements en made within the industry to refer the n of payment for wet time for negotiation ttlement.

Monthly Return of Apprentices.

Wheatley informed Sir K. Wood that he eady undertaken to consider, in con- n with the Industrial Committees he d to set up, the possibility of obtaining hly return of apprentices. He could not ake, however, to furnish this information iculars of the men employed on housing s during the Recess. The present from local authorities did not provide information, and it was impracticable ain particulars of the number of men ed by private enterprise on housing

Rents of State Houses.

Meller asked the Minister of Health r he was now prepared to state what ements he had made to meet the dis- that would arise if houses built under housing schemes were let at a lower han houses of a similar type built under s Housing Acts ?

Wheatley said he did not anticipate that ficulty which the hon. member had in would arise and he did not propose to ny arrangements at the present time.

A London Scheme.

unt Curzon asked the Minister whether, giving his approval to the erection by the County Council of five-story dwellings ing about 537 tenements, with accom- on for over 3,200 persons on a site of ight acres at East Hill, Wandsworth, a involving the erection of approximately es to the acre, his attention was drawn Wandsworth Ratepayers' Association to nistry of Health Circular 388 A, of 15, 1924, expressing the opinion that the of approximately twelve houses to the acre represented a desirable standard, and that, as a general rule, a local authority should not approve the building of more than 20 houses on any one acre; and on what grounds he gave his approval to this scheme which involved the construction of roads of a less width than 40 ft. and of a steeper gradient than 1 in 20 which were the minima prescribed by the London Building Act, 1894 ?

Mr. Wheatley said the scheme was approved before he assumed office. He understood it was the intention of the London County Council to use this site as a rehousing site in connection with schemes for the clearance of insanitary areas. In view of the scarcity of suitable sites for rehousing in the County of London, and of the altitude and open situation of the site in question between the river and a large common, it was considered that some departure from normal standards could be justified. This decision was reached after full examination of the objections raised.

Hadrian's Wall.

Major Church asked the First Commissioner of Works whether his attention had been called to the suggestion to restore certain parts of Hadrian's Wall; and whether he would give his earnest consideration to the project, seeing that it would provide work for a certain number of unemployed under skilled supervision and at the same time present to the nation a memorial of great historical and educational interest ?

Mr. Jowett said he could assure the honourable member that a project of this kind would be viewed with the greatest sympathy by his Department. There was, however, no part of the Wall in the charge of the Department, and under the existing legislation dealing with ancient monuments the Department was not empowered to spend money on repairs or excavations on monuments not in its charge.

Emigration of Skilled Workers.

Mr. R. Morrison asked the Parliamentary Secretary to the Overseas Trade Department whether his attention had been drawn to advertisements now appearing in the press, inserted by the Empire Settlement Bureau, offering assisted passages to one of the Dominions to skilled carpenters, bricklayers, plasterers, masons, and plumbers; and, in view of the great importance for house-building purposes of retaining as many of these skilled workmen as possible, whether he would see that these men were not encouraged to emigrate.

Mr. Lunn said that the answer to the first part of the question was in the affirmative. As regarded the second part it was understood that the advertisement had been authorised by the Government of Australia; that the number of skilled workers required was strictly limited, and that the opportunities offered were likely to be advantageous to the individual. In those circumstances, it had not been considered desirable to interfere.

Non-Parlour Houses.

Mr. Wheatley informed Sir K. Wood that the following were the average prices of non-parlour houses (excluding cost of land and development), included in contracts let by local authorities during each of the months from January to June, 1924, the latest date for which figures were available:—January, £384; February, £389; March, £418; April, £416; May, £408; June, £421.

Houses Built in London.

In reply to Colonel Vaughan-Morgan, who asked the number of dwelling houses erected and in course of erection, in the County of London, and in the area of Greater London within the last three years, Mr. Wheatley said that in the County of London the number of completed houses was 12,594. There were 1,512 in course of erection, making a total altogether of 14,106. The number completed by private enterprise without State assistance, the figures for which were only available for the eighteen months prior to March 31 last, was 2,563, while 1,379 were in course of erection, bringing the total up to 3,942. There were 25,768 dwelling houses completed in the Greater London area (including the county), and 3,801 in course of erection, a total of 29,569. Those completed by private enterprise without State assistance for the eighteen months prior to March 31 last numbered 16,663, there being in course of erection 8,739—a total of 25,402.

Brickfields Development.

Mr. Richards, replying on behalf of the Minister of Health to Mr. W. Thorne, said that the report of the National House Building Committee showed that all the brickfields of the country were not yet working at full capacity. The Government had taken the most practical steps for securing an increase in production, by the adoption in the new Housing Bill of a long programme of house building which would enable manufacturers with confidence to develop their resources and increase their output.

The Building Dispute.

Mr. Shaw, the Minister of Labour, in answer to Sir K. Wood, said that the situation in regard to the building dispute was more complex and difficult than any he had ever known. He found that neither the employers nor the men believed in the good faith of the other. That being so, the difficulties were very great indeed. There would, however, be a further meeting of both sides on August 6. As to what the extra cost on housing would be if certain eventualities were to arise, that was a hypothetical question which might be left to the future. It would be perfectly easy to make an attack either on the employers or on the men—there was plenty of ground for it—but it would be wiser to allow the industry to come to its own conclusions.

THE HOUSING BILL.

The House of Lords considered the Housing Bill in Committee on Monday, August 4.

Before going into Committee, the Earl of Midleton moved "That this House resolves that, having regard (1) to the great charge on public and municipal funds involved in the Bill; (2) to the deficiency of skilled labour and increasing cost of materials; (3) to the consequent delay and enhanced cost in erecting the necessary houses—an immediate inquiry should be set on foot by His Majesty's Government as to the possibility of building houses of other materials than brick, which could be erected more rapidly and at less cost." The noble Earl referred to the speech of Lord Weir on standardisation (reported in *The Builder* last week), and said the Government had two alternatives to consider in view of the high cost of brick houses and the shortage of bricklayers. The first was Lord Weir's house, which could be produced for less than £300, and the second was the undoubted facilities that existed in Canada for building wooden houses on a system that would not require the labour of carpenters in this country. These houses could be sent over here by the hundred thousand as quickly as we could put them up, and could be provided in the opinion of those who knew, at from 20 to 30 per cent. less than a brick house. Wooden houses could also be obtained from Scandinavia. Further, there were houses made of wood and concrete which could also be produced at 30 to 40 per cent. under the cost of a brick house. If either of these alternatives were accepted the emergency could be met for three or four years, but there was no possibility that that could be done under the Government's scheme with brick houses.

The Lord Chancellor, on behalf of the Government, accepted the motion, saying that it did not really go far enough. The Minister of Health intended to hold an inquiry, the scope of which would be wider, with regard to points connected with production and economic distribution. It was a great mistake to suppose that there would be any hard and fast way of building the new houses. All such propositions such as those put forward by Lord Weir would be considered. Even the wooden houses from Canada and Scandinavia might be considered. In fact, any proposal which would produce

houses quickly and cheaply would be looked at gladly.

The motion was agreed to.

The House then considered the Bill in detail. Few alterations of substance were made. On clause 3, which deals with the conditions to be attached to the letting or sub-letting of houses, the Lord Chancellor moved an amendment to provide that consent should not be given to the assignment or sub-letting unless it was shown that no payment other than rent had been, or was to be, received by the tenant in consideration of such act. The amendment was agreed to.

An amendment, moved by Lord Strachie, to provide that the rents charged should not be higher than would be payable if the houses were let at the appropriate normal rents charged in respect of pre-war working-class houses of similar size, type and amenity, was carried against the Government by 42 votes to 9. The Lord Chancellor feared that the amendment would lead to the standardisation of houses.

One of the chief alterations was made on clause 4, where an amendment, moved by Lord Strachie, was carried against the Government, providing that the housing position shall be reviewed in 1926 instead of 1927, and after every second year instead of after every third year.

On clause 10, which deals with materials and methods of construction, Lord Sumner moved an amendment providing that if a local authority refused, without reasonable cause to adopt a new material or method of construction which the Minister deemed suitable, and further refused, on reconsideration, without reasonable cause, to adopt such new methods, the Minister might make such deductions from the Government contributions as he deemed reasonable.

The amendment was agreed to, and the Bill, as amended, was reported to the House.

On the report stage, on Tuesday, Lord Banbury moved amendments to provide that where houses that are provided under the Bill by the Common Council of the City of London and the London County Council make supplementary contributions, the amount of the latter should be treated as part of the expenses borne by the local rate in the City. The Government accepted these amendments, which were agreed to.

An amendment moved by Lord Strachie, to specify that the tenants to whom houses built by the local authority under the Bill are to be let shall be "members of the working classes," was accepted by the Lord Chancellor and agreed to.

The report stage was then concluded and the Bill read the third time.

Kensington High-street.

The Kensington Borough Council recently approved of a scheme for the widening of High-street on the south side.

This would be done by the setting back of Messrs. John Barker's main frontage, and that of Messrs. Derry & Toms from the Metropolitan District Railway Station Arcade on the west to Young-street on the east. The new line of frontage would, if the scheme is carried out, effect a widening of upwards of 20 ft. at one part. The proposals include the building over of Ball-street at the back of Barker's main buildings, and certain mewsways, and the widening of King-street, leading to one side of Kensington-square. A considerable widening would be effected in what is now the narrowest part of Kensington High-street, in front of the Town Hall.

Obituary.

The death has occurred of Mr. Ben. Jones, builder and contractor, Henfren House, St. Clears, Carmarthen, a former member of the Carmarthen R.D.C. and Board of Guardians.

Messrs. Morner & Co.

In Messrs. Morner & Co.'s announcement in our last issue the price of their P.P.P. Flooring was given as 9s. This should have read 10s. 6d. per sq. yd. The address of this firm is 54A, Parliament-street, S.W.1.

ROYAL SANITARY INSTITUTE ANNUAL CONGRESS—II.

The annual congress of the Royal Sanitary Institute was held at Liverpool last month. Some account of the proceedings, and a report of the first day's meeting of the section of architecture and engineering were given in our issue of July 25, and is continued below:

SUBSIDY HOUSES.

MR. SEARLES-WOOD moved the following resolution :—

> That the Council of the Royal Sanitary Institute be recommended to urge upon the Minister of Heath the undesirability of perpetuating the 1923 standard of types and sizes for the building of two-and-a-half million houses during the next fifteen years.

In his opinion it was stupid to tie local authorities down to those dimensions for such a long period.

In seconding the resolution, SIR HENRY TANNER said flats were wanted as well as houses; small dwellings were in greater demand than houses. In urban areas it was impossible to build twelve houses to the acre, and people who lived and worked in towns did not always want to be moved four or five miles into the country. In one scheme recently carried out there were over sixty dwellings to the acre in three-story buildings, and, with plenty of open space around, they were quite as healthy as separate houses and considerably cheaper.

MR. BROWNRIDGE, speaking against the resolution, said, in his opinion, the minimum and maximum sizes laid down allowed plenty of scope, and having regard to the fact that houses were so badly needed it would be better not to harass the Government further by raising this point now; in Birkenhead they had built a variety of very good houses under those restrictions.

THE MAYOR OF WEST HAM raised the question of boroughs such as his, where there was no room to spread the population, as the area of the local authority was hemmed in by surrounding authorities. It had been suggested that they should go outside their own area and build houses miles away. But in his borough, 50 per cent. of the male population were casual labourers at the docks, who had to apply for work three or four times a day, and it was impossible to ask those men to remove to new houses miles away from their work. He objected to the hands of the local authorities being tied to the types of houses laid down by the Government. With full use of modern scientific methods of building, and a proper conception of its responsibilities, it would be possible for the local authority to provide adequate accommodation in its own area, and, moreover, if they had more freedom they would be able to build good houses at lower cost and thus let them at lower rents. In West Ham, for instance, the problem could best be met by the erection of flats in three-story buildings, with an open space in a central courtyard in which the children could play. By that means they could house everybody in the borough, without the necessity for going outside, under as good conditions as under the Government scheme.

A delegate from Sunderland said the Corporation of that town was building sixteen houses as an experiment, to see exactly what profit private enterprise was making, but it was found that the cost of building by direct labour was as much as by private enterprise.

MR. HILL (Liverpool Property Owners' Association), said property owners were quite in favour of improving housing conditions. In the case of unhealthy areas, however, property-owners were not invited to co-operate with the Health Committee, but were faced with a very penal legislation. He suggested that, in the case of unhealthy areas, property owners should be invited to try to discover a method of improving the conditions at li cost, and that a subsidy should be allo them to improve their property. By means he thought slum property could be m healthy at less cost to the rates than by present method.

After some further discussion, the resolu was withdrawn.

HEALTH EXHIBITION.

A well-known and appreciated featur connection with the Congresses of the R Sanitary Institute, the Health Exhibitio always of interest to those concerned with well-being of the public. This year's show opened by the Lord Mayor of Liverpool, expressed the opinion that it should do fo general health of the country what the Br Empire Exhibition was doing for the t of the Empire.

The majority of the exhibits were conce with foods and personal hygiene, but a nu of products of interest to architects and bui were to be seen. One of the largest stands that of the Public Health Departmen Liverpool, which included models sho the unhealthy areas already dealt with the types of new houses erected under housing schemes. A new glazed wall l was exhibited by Messrs. Marvle Proo Ltd., of Wellington-road, Battersea, which is claimed to be much cheaper any other type of permanent glazed wall li The basis of the material is concrete, the su being cold-glazed in any desired colou mixture of colours. The material ca drilled in order to fix it to existing walls, we are informed that the surface does crack or craze. Other exhibits included sa apparatus by Messrs. Jones & Attwood, (Stourbridge); wood-working machiner the Dominion Machinery Co., Ltd. (Hali gas and coal heating apparatus by M Sidney Flavel & Co., Ltd. (Leamington); disinfectants by the Lewbart Manufact Co., Ltd. (Norfolk-street, W.C. 2).

The following are among the awards c judges :—

Silver Medals.—Dominion Machinery Ltd.; Sidney Flavel & Co., Ltd.; Jo Attwood, Ltd.

Bronze Medals.—Dominion Machinery Ltd.; Easiwork, Ltd.; Lewbart Manufac Co., Ltd.; Loft Ladders, Ltd.

LAND FOR A NEW RO

MR. J. D. WALLIS, Official Arbitrato issued his award in a claim by Mr. Daniel Coates against the King's Lynn Corpor touching the Corporation's compulsor quisition of 1,556 sq. yds. of land in conn with the formation of a new road. The aw as follows :—

(1) The Acquiring Authority to pay t owner the sum of £395 as purchase mone compensation; (2) the Acquiring Author pay interest at the rate of 5 per cent. per a from the date of entry until payment of th pensation; (3) the Acquiring Authori pay the fees on this award; and (4) the to pay the sum of £21 towards the costs Acquiring Authority.

At the hearing of the claim, Mr. H. Wilkin, F.A.I., giving evidence for the cla valued the land at 12s. 6d. per sq. y £972 10s. 6d. There was also a claim b Coates for valuer's and architect's fees, professional charges, &c.

On behalf of the Corporation, Mr. Widdicombe, F.S.I., District Valuer, sub a valuation of £302.

THE BUILDING TRADE

UCATION IN THE BUILDING INDUSTRY

he annual Conference of the Institute of rs with the Teachers of Building in Great , Major R. J. Holliday (Vice-President nstitute of Builders) read a paper entitled Absorption of Well-educated Youth in the ry for Training for Managerial Positions." tever might be the ultimate development echnical education policy of the Institute lders, he said, the facts that that body ised the need for technical education and finitely committed to assist in its encou- nt imposed upon it the responsibility of ring the nature and scope of the technical ion required, how that technical education e usefully employed, and what arrange- could be made to that end.

cation without opportunity for its full s wasteful, and in the long run destructive t, and no body of men representative of ortant industry and desirous of securing imum efficiency could afford to neglect the technical education for its service, or l employment and development of that al education in its service. It therefore important for the Institute of Builders, was taking an interest in technical educa- consider the capacity of its industry to the youth who had received a higher ion for it, the qualifications it demanded uch youth, and suitable methods of con- and developing the education it had d.

nvenient starting-point was a considera- the industry's organisation in relation to neral tendency of the commercial world. f the marked characteristics of current ial conditions were the tendency towards isation and the tendency towards larger sations. Both tendencies resulted in the oment of the departmental system of and the creation of managerial positions. tain industries it would appear possible both tendencies had been carried to es, that the limit of human ability to from some central point had been reached hat a policy of decentralised control ding a type of manager with general than specialist qualifications had had to opted.

ibly for reasons of technical requirements, liarities of the industry's organisation, or son of its freedom from external com- n, the building industry did not seem to hared to the same extent as other indus- the tendency towards larger organisa- True there were businesses which oper- ll over the world, and businesses which ed all over the country, and although it be argued that all large building concerns ed under a system of decentralised control contract being a separate unit under the iate control of a man on the spot and the te control of the central office) there were ely few building businesses under the ty of establishing district control points n their central office and works and their g contracts.

ertheless the amalgamation of large con- nd the tendency of building contractors ate over a wider field led him to his first sion, that the building industry was , and would continue to share, in the l trend of the age, resulting in a growing cy to create managerial positions, an e in the number of departmental managers d, and a demand for bigger men in this f the industry.

he present time, in addition to such people tract managers and general foremen, and y one or two others on the administrative f the business, the organisation of all ant building contractors was sufficiently ped to necessitate such departmental ers as works managers, yard managers, managers, buyers, estimators, measuring surveyors, cost accountants, and company secretaries. And while it would be unreasonable to forecast a very much larger demand for the managerial type, it would be less reasonable to assume that the capacity of the industry to absorb this type had reached its limit, or that there was not room for a considerable development in the administrative and earning capacity of the type.

The better the organisation and the bigger its scale the greater would be the demand for the managerial type. It would be foolish to imagine that in a highly industrialised country such as this they could look forward to an unlimited demand for new buildings. It might even be remarked that the shortage of labour, which was probably due in part to an actual shrinkage in the supply, indicated that the industry had reached the limit of its expansion under its present organisation. But the effect of improved method and the artificial and other controls which existed in every industry made such rapid conclusions dangerous; and he was of opinion that there was evidence that the day was far distant when the demand for rebuilding and new buildings in this country would become stabilised. The progressive movement of trade in which the industry played such an important part in its provision of adequate buildings was likely to involve a fairly steady and, it seemed reasonable to assume, an increasing demand upon the industry. That demand would, to some extent, exist in spite of or because of the supply, according to the inadequate or adequate character of the industry's organisation. It was well to keep in mind that not the least important part was played in this question of volume of demand by the response in efficient craftsmanship and organising ability which the industry made to it; for just as organising ability lowered cost and stimulated the demand so did organising inability raise cost and diminish the demand.

The capacity of the industry to absorb the managerial type would for a long time be limited rather by the technical qualifications of its departmental heads and their ability to develop than by such considerations as the demand for building; and the capacity of the industry to absorb youth with a view to their training for managerial positions would depend very largely upon the natural qualities and the educational qualifications of youth received from technical institutions and other sources.

In that connection he would emphasise the paramount importance to the industry in its higher ranks of a technical education which would develop an appreciation of the industry as a whole, even at the expense to some extent of a specialised knowledge, and of an educational authority which would assist businesses by a preliminary estimate of students' qualities and by their scientific development.

The difficulty of selecting the future manager in the early stages of his career was enormous. Rarely was the undoubted leader or the managerial type discovered without careful observation. There were technical schools to-day which decided at an early age the special craft a student should follow from experience of his work, and in this grade of employee the work of the technical education authorities in this direction was extraordinarily valuable. On the other hand, it would appear desirable for the day and evening technical education of higher types to be upon as broad a basis as possible, with a view to securing the students' appreciation of the broad requirements of the industry and of ensuring the discovery of the future managerial type rather than to limit the study of this class of student to a narrow field and to trust to luck or accident that their qualities would become apparent before it was too late to develop and to make full use of them.

The industry was full of specialists who had specialised from a relatively early age and who had never been given the opportunity of acquiring the broad knowledge necessary to management; and it was probable that they were carrying to-day in one or another minor capacity men who with wider opportunities of discovering their abilities would have developed into the managerial type, to the general advantage of the industry and the particular advantage of the business in which they were engaged.

The keystone of the successful absorption of youth in any industry was a close co-operation between a technical authority alive to current conditions and requirements of the industry, and the business heads of the industry equally alive to the current conditions and requirements of technical education. These conditions were necessary in order to secure a perfect link between school and business in a logical development of the educational foundation that had been laid, and a full employment of the principles that had been learnt. There was plenty of room in the industry for men in important managerial positions, and there was a heavy responsibility upon the educational authorities of this country to see that the right type came into the industry adequately equipped to ensure their maximum ability output.

The youth which came into the building industry might be broadly divided into two classes. For the most part he came in to fill a vacancy, more especially when he came in on the administrative side, so that, although he believed there were businesses who had definite schemes of training to ensure a broader development than was generally possible in the single department or trade, it was doubtful whether there was generally any clear-cut plan for the development of likely youth beyond their advancement in the department in which they began and where they often ended. There was a good deal to be said for this early specialisation in the present organisation of the industry, but it was wasteful to the extent that it restricted the vision of youth and hindered the discovery of that managerial type which the further development of industrial organisation stood in need of.

For the rest he came in to be taught the business "to the best ability of the employer." He would start at the beginning and go right through the business. In these busy and arduous times, this usually resolves itself into giving the youth an opportunity under a varying supervision to see and to do something of what is going on within the limits of a general plan of a period in the shops, a period on a contract, and a period in the various departments of the office.

Where the latter system obtained, all the seniors were held responsible for the instruction of the juniors, as except in special circumstances no promotion was granted unless the candidate for it had an understudy ready to step into his shoes. Thus a fairly complete ladder of promotion was provided which had the advantage of keeping everyone up to his work and reaching out for the post higher up, if he would avoid the risk of supersession. Of course it would not be possible for building contractors to carry a large number of students in the hope that they would be ultimately absorbed, but there was a normal demand created by wastage and development which it might be well to meet to some extent by the wider introduction of the student class into businesses before the actual need for the finished product was felt. In any case, it should be the aim of all modern employers to keep in view the qualities of their employees, to secure for them opportunities to prove their worth in higher capacities, and therefore to consider plans to that end. Or it might be possible by a revival of the apprenticeship system embodying a well-thought-out scheme of training (designed to continue and to develop in the business the education that has been received in the technical schools) to ensure

a better controlled flow of suitably trained youth into the industry who would there receive that fair field and open opportunity which it was in the best interests of every industry to afford it.

The main difficulty in the organisation of a system of advanced training in the building industry seemed to lie in the financial difficulty in the way of many businesses usefully to carry a qualified man of the instructor class, in view of the limited number of students he would be called upon to supervise. The idea had occurred to him that if the suggestions he had put forward were to be adopted it might be possible for groups of builders to employ area supervisors with teaching and practical experience whose duty it would be to supervise the business training of students in their area, to test their progress, and to act as liaison officers between school and employer. Such a system would place this important matter in the hands of a specialist and make for a valuable interchange of teaching method and current practice. But although the principles of business were fairly constant, there were local variations in practice which would probably render such a system very difficult in operation.

At the present juncture the best solution would seem to lie in the development in each business of a course of instruction which he had outlined, under the supervision of the various people indicated, and subject to the ultimate control of the various directors interested who would take such opportunities as they could to test progress. It was a system which he believed had worked well in another industry, and one which seemed likely to succeed in obtaining the desired product from the right material.

Assuming that every student would have studied the outlines of commercial history and economic geography which in practice were of considerable importance as a background, he would suggest that the general training of the picked student should be divided into four periods before he proceeded to specialise in any particular department, and that his movements and outline instruction should be as follows :—

PERIOD A.

In the Secretary's Office.—The organisation of the industry; Function of its members; Finance; Company law; The organisation of the business; Functions of its departments; Insurances; Contract and common law; Local government regulations.

In Estimating and Surveying Office—Preparation of an estimate; labour rates and conditions.

On Building in Course of Construction (under the general foreman).—Ordering plant and preliminary materials.

In Yard or Depots (under the Yard Manager). —Plant, materials, and transport.

On Building in Course of Construction (under the general foreman).—Labour control and supervision; ordering materials; co-ordination of sub-contract work; measuring up.

In Office and on Building (under the Measuring Surveyor).—Preparation of final account.

PERIOD B.

In Estimating and Surveying Office.—Preparation of estimate.

On building in Course of Construction.—Its location, character and problems.

In the Joinery Mills (under the works manager).—Preparation of joinery work.

In Prime Cost and Accountancy Department. —Analysis of costs.

In Office and on Building (under the measuring surveyor).—Preparation of the final account.

PERIOD C.

In Estimating and Surveying Office.—Preparation of estimate.

On Building in Course of Construction.—As for Period B.

In the Office (under the buyer).—Buying materials; Placing orders and sub-contracts; Transport facilities; Visits to manufacturing works to learn something of manufacturing processes and costs, and material supply possibilities of areas.

In the Office and on the Building.—Preparation of final account.

PERIOD D.

In the Secretary's Office—Revision; Correspondence; Disputes; Arbitrations; Accountancy.

In the Office (under the outside manager or director).—Managerial control; co-ordination of works in progress.

In the Office.—Personal supervision.

Under that scheme the student's starting-point was an appreciation of the organisation at the back of the business and the conditions within which it operated. In each of the periods he would have an opportunity of making a critical and well-informed survey of an important section of a contract, in addition to learning something of the machinery of a contract from its inception to its completion. How far such a scheme would be generally practicable it was difficult to say, but some such scheme seemed necessary to encourage the entry into the industry of the right type of youth and to secure for him that opportunity for development on broad lines which was so desirable before the stage of departmental specialisation was reached.

A JOINT COUNCIL FOR THE BUILDING TRADE

By S. STRANKS (*Organiser, Amalgamated Union of Building Trade Workers*).

THERE are certain forces in human affairs which, in spite of prejudice, vested interest, indifference, and ignorance, are always operating to bring about change, economic factors, the spread of education, and other forces contribute to this end. This state of evolution recognises no limit to human progress. There is always room for differences as to the wisest course to direct these desired changes, but the main difficulty is due to our being wedded more or less to our personal interests and prejudices. Just as the individual reflects this particular phase, so employers' and operatives' organisations are prone to become victims to the same factors, but in all cases these eventually have to give way to the common good. But there is this difference between the individual and associated effort, that the latter force quickens the rate of progress. Certain phases of associated effort have indulged, and as reflected in present building trade dispute do indulge, in the a species of warfare which any intelligent person would much prefer to avoid. In face of facts pertaining to present conflicting economic and social life, many resign themselves in a philosophical manner to such warfare as being a mere phase in evolution; if our mental outlook does not respond to a higher plane in settling our differences, then we must go through the bitter experience till we embrace a more reasonable and rational policy.

Can the different interests in the building industry mark their experiences, coupled with a frank recognition of differences engendered, and centre on the idea of a revival of a Joint Industrial Council as a medium of threshing out questions pertaining to the industry and arriving at decisions aiming at the common good? Before answering this question it is essential to appreciate certain fundamental facts which are a forerunner of the present difficulty.

The fundamental difference is due to the employers and operatives being divided into two classes. It is no use ignoring this fact; society has created this condition, and as a result the employer is looked upon as the captain of industry and all it implies; but past history suggests that this view will have to give way. There are fundamental differences of opinion which time will work out, but pending this operation there are reforms in our industry which call for practical adjustment; hence the need for a mutual ground whereby these matters can be decided.

If we turn to the operative of the present day we find he is evolving an outlook which is making a claim for a higher status of life; he is out for higher wages and other matters of material benefits, but above all, he is gradually taking up an attitude of resentment against the idea of being a mere accommodation to a power which is the outcome of the mental outlook of past generations.

Due appreciation having been gi fundamental differences referred to, ground exist upon which we can bas that through a Joint Industrial Co can accrue? Can such a channel parties to bring about a solution of ideas and principles by the power rather than force? Certainly the la does not impress those who took deliberations; it became charged judices which gave small chance for and tolerant minds to prevail. The t in the building industry will not en similar venture without having some that time and money spent on it w ductive of good. Further, if such a succeed it must be inspired with a pr There must be many in both camps with the need of such a body. Ma all who are obsessed with the idea t body would merely resolve itself int compromising machine, that this w that logically no representative assem survive? The House of Commons Councils, and other administrative b precisely the same difficulty, but demand they get on with the busines the building industry say the same? to find some way out of the prese conditions. Which is it to be—force

There are practical questions on Joint Council could be of great s Mr. Stoker, K.C., is to be comm ventilating this matter in your col refers to the question of apprenti beyond the bounds of possibility t scheme that will place this questi conflicting interests? If there a revival of that real interest in app that is desired, the question has to be from a different angle altogether fro and a much broader outlook must to bear on this question.

In face of the failure of agreement lish a rational system of mess-room some action must be taken to work ou by which a uniform standard of acco whereby the health and comfort of are secured. There is no tangible negligence in providing this impor If efficiency is to be attained, the consideration should be the creati ditions which conduce to such. Industrial Council ought to project standard for guidance in this matt

Again, take preventive measur protection of life and limb, and dise all these matters ought to be cons measures adopted to obviate sufferin of money.

Surely the time has arrived wher question of overtime should be rer the misunderstanding which obt economic grounds, and in the inte community, the continual jarrin question does little credit to any believe it is possible to define a would remove our differences and new departure which would redo credit of all. Again, on this, the field for a Joint Council.

Cannot something be done in th of projecting uniform rules for Works Committees? I know evide jobs indicated a lack of sense of p things on the part of some opera Works Committee existed, but indi found their level. Here is a field f consideration of all interests involv to agree to the recognition of W mittees with properly-defined functi

Are we to display to the commu jointly have no ideas by way o education, technical and otherwise expert knowledge in the industry t be a sphere of action which would on these highly-important subjects. touches the value of a Joint Co matters of a legislative, or adv character, in the domain of imperi government.

A Joint Industrial Council shou oughly representative of all enga

—architects, builders, surveyors, neral foremen, sub-contractors, s, and would provide a council ul selection of the representatives immense value.

I do the stagnant pool of negation the councils of employers' and ociations, I feel there is a deal of ne before we reach agreement. t recede, suspicion must subside. in an age when organisation is ecessary in social and economic problem confronting us is the ress the physical to the detri- nental factor. (For rates of wages in the Building Trade in Scotland, see page 229.

is frank, fearless discussion and willingness to accept a new order, a new system, to meet the needs of a changed world—reconstruction, worked out with goodwill all round for the benefit of all concerned. JOHN E. YERBURY.

SIR,—We should like to direct attention to the proceedings being taken in connection with the agreement required to be signed as a condition of operatives being allowed to return to work in the London area.

On July 10 last we wrote to the National Federation of Building Trade Operatives (London Regional Council), asking for copies of the agreement. Two were forwarded to us on the 11th, with a letter stating: "I am enclosing two copies of the Provisional Agreement required for carrying on work during the present dispute. Will you kindly return same with your signature attached, and I will then return one copy for your own use."

The printed form of agreement refers in paragraphs *a* and *b* to wages, and provides for 1d. per hour increase; paragraph *c* sets out the hours of labour (44 hours per week).

The next paragraph is as follows: "Time lost in consequence of circumstances over which the workers have no control shall be subject to immediate local arrangement between the employer and the London Regional Council of the N.F.B.T.O., such negotiations shall be completed forthwith."

The Bromley builders have agreed to paragraphs *a*, *b* and *c*, but not the paragraph referring to payment for lost time. On Tuesday, last week, a conference was held between the Bromley master builders and the local strike committee, which was also attended by a representative of the London Regional Council. Being asked what would be the procedure after signing the agreement to put into effect the negotiations suggested in paragraph *re* lost time, the delegate stated that what was required was 50 per cent. payment for lost time. That was the demand and unless it was conceded men would not be allowed to work.

It is quite obvious from this statement that there is to be no question of "arrangement" or "negotiation," and it would appear that the signatures to the agreement are being obtained under false pretences. Under these circumstances the builders of this area refuse to sign.

Bromley. PEARCE BROS., *Builders.*

After the break-up of the Conference, as announced in our columns last week, a statement was issued by the National Allied Building Trades Employers denying the statement that the delay in the proposed meeting with the Liverpool representatives was due to obstacles placed by the employers in the way of an earlier meeting. The statement that the employers were trying to "break the operatives' federation" was stated to be equally untrue. An employers' official stated to a Press representative last Saturday that "While deploring the necessity to continue the struggle, we are satisfied that the situation develops steadily in our favour. Our object in posting lock-out notices has been justified, for it brought the issue to a head, and is hastening a settlement. The latest news from our regions is that, even in districts where the posting of lock-out notices was attended with difficulty and hardship for some of our members, it has since been decided to post them nevertheless.

Mr. R. Coppock, general secretary of the National Federation of Building Trades Operatives, was the principal speaker at a meeting of members of that organisation held at Hoxton. He said the representatives of the men were trying, consistent with their general policy, to bring an end to the dispute at the earliest possible moment. They believed that the first call on industry should be for those who were working in it. The reply to the question as to why they had changed their policy from national to regional settlements was that they had had to design a policy which would meet the tactics of their opponents.

On Wednesday a conference was held at which the National Federations and employers and operatives from Liverpool had been invited to attend.

CONTRACTS, COMPETITIONS, &c.

Forsome contracts still open, but not included in this List, see previous issues. Those with are advertised in this number. Certain conditions beyond those given in the following are imposed in some cases, such as that advertisers do not bind themselves to accept the low tender; that a fair wages clause shall be observed; that no allowance will be made for ten that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or of those willing to submit tenders, may be sent in; the name and address at the end is the person or place where quantities, forms of tender, &c., may be obtained.

BUILDING AND PAINTING.

NEWARK.—Plans are being considered by the Governors of the Girls' High School for the provision of a central hall and other improvements, at a cost of about £3,000.

NORTHAM.—The U.D.C. General Purposes Committee presented a scheme for dealing with coast erosion at Westward Ho! at an estimated cost of £6,000, and recommended application to the Unemployment Grants Committee with a view to asking the sanction of the M.H. to borrow £6,000. This was approved.

OLDHAM.—Plans have been prepared by Messrs. Taylor & Simister for alterations at the Town Hall to provide for a retiring room for the Councillors. The erection of a children's hospital is recommended. Plans passed:—Conversion of portion of the White Bear Inn, Market-place, into business premises for Mr. J. R. Plowright.

PETERBOROUGH.—Plans passed by T.C.: Bungalow and garage at Park-road, for Mr. J. R. Johnson; two houses, Russell-street, for Mr. J. G. Maddison; house, Gladstone-street, for Mr. J. G. Maddison; house at Park-crescent, for Mr. P. J. Fairweather; house at Broadway, for Mr. Andrews; house at Grange-road, for Mr. Elmer; house at Harris-street, for Mr. A. F. Stevens. Before deciding as to the widening of Narrow-street, the Corporation has arranged to ascertain the probable cost.

PLYMOUTH.—Plans passed by T.C.: G. A. Daymond, five houses, Bridwell-road; W. R. Littleton, six houses, Lyndhurst-road; M. M. Hart, bungalow, Mutley-road; A. Spurrell, house, Compton Park Villas-road; W. H. Joce, two houses, Compton Park-road; F. Packer, two houses, West Down-road; J. Roberts, addition, 91, Mutley Plain; Committee of South Devon and East Cornwall Hospital, addition to pathological block, South Devon and East Cornwall Hospital; Kimbers, 20 lock-up garages, Devonport Station, G.W.R.; G. H. Webber, five houses, Rowden-street; W. R. Swiss and T. F. Savage, two bungalows, Wolseley-road, Saltash-passage; F. Westcott, bungalow, Bladderley-road.

PRESTON.—Plans passed by T.C.: R. Cooper & Sons, for J. A. Butler, house and shop, Holmrook-road; F. N. Pinder for E. Atkinson, two houses, Frenchwood-avenue; J. Nightingale for J. Wilding, house, Brackenbury-road; J. Nightingale, four houses, Addison-road; A. J. Duckworth, for Mrs. W. Ralphs, bungalow, Heather-grove; V. B. Norton, bungalow, Lytham-road; J. W. Grange, three bungalows, Lytham-road; T. Bradley, bungalow, Ribbleton-avenue; J. Sargent for Sargent & Fish, four houses, Primrose-road; E. J. Andrew for G. Carter, bungalow and garage, Watery-lane.

RADCLIFFE.—It is proposed to construct a new road from Radcliffe to Manchester, through Darcey Lever.

ROCHDALE.—Plans for two bungalows were approved by the Housing Committee. The Housing Committee recommended the Council to invite offers for the purchase of freehold plots of land on the Turf Hill Estate for the erection of permanent shops.

RUGBY.—The M.H. has approved a sewage scheme. The B.E. has passed plans for the proposed new secondary school.

ST. ANNES.—The Corporation has in hand another building scheme, which follows the acquisition of suitable areas of land at Squires Gate. On these it is intended to erect, as soon as possible, 20 houses.

SEDGEFIELD.—Plans passed by R.D.C.: Bakery at the Broom, Ferryhill, Mr. E. Callend; house and garage, Chilton Buildings, Mr. J. P. Coulson; conversion of two cottages into shop, Trimdon Grange, Mr. Farmer.

SELBY.—The West Riding C.C. are going to build a new bridge over the canal in place of the old stone bridge, at a cost of £15,000.

SELSTON.—The B.E. has passed plans for the erection of an iron building for 60 scholars at the Portland-row Council School.

SHENLEY.—Middlesex C.C. have appointed the County Architect to act in connection with the erection of the buildings at the Porter's Park Estate, recently acquired for the provision of further accommodation for mental defectives.

STOCKTON.—Plans passed by R.D.C.: Bungalow, Thorpe Thewles, Mr. W. Howe; house, Wynyard-road, Wolviston, Mr. Loughran, Port Clarence; house, Wolviston Green, Mr. Dearlove; house, Preston, Mr. F. Hay; house, Elton Back-lane, Mr. W. Beswick, Stockton; bungalow, Preston, Mr. J. Wheatley.

STOKE NEWINGTON.—The Public Library Committee has been empowered by the B.C. to accept the most favourable tender for the extension of the public library. A committee has been asked to report as to the provision of a swimming bath for the borough.

STRATFORD-ON-AVON.—The R.D.C. have prepared plans for additions to the old Toolgate Cottage at Wootten Wawen, but the Warwickshire C.C. suggests an entirely new building further back so that the road can be improved there.

STRETFORD.—A new secondary school for boys is proposed by the Lancashire C.C.

SUNBURY.—The Middlesex C.C. has decided to include an assembly hall at the new council school, which Messrs. C. J. Newby Bros. are erecting. The estimated cost is £2,000.

SWINTON.—Lancashire C.C. proposes a secondary school for Swinton, Pendlebury and Worsley.

THORESBY (NOTTS).—In connection with the new railway to the New Colliery the L.N.E.R. are to construct a bridge on the Ollerton–Mansfield main road.

TOTTENHAM.—The Middlesex C.C. propose alterations at and additions to the Tottenham Courthouse and Polytechnic. The scheme has been prepared by the county architect. The county architect estimates the cost of the work at £2,500.

TYNEMOUTH.—Plans passed by T.C.: Shops and flats corner of Hawkey's-lane and Newcastle Turnpike, for Mr. Percy Scorer, by Messrs. F. R. N. Haswell & Son; War memorial, West Allotment, for West Allotment and District War Memorial Committee, by Mr. W. Wright; four houses, Kirton Park-terrace, for Mr. Beautyman, by Messrs. P. L. Brown & Son; two houses, Kenners Dene, Tynemouth, for Messrs. J. F. Newbold & Co., by Mr. A. K. Tasker; 16 houses on the Hunt Hill Estate, for Messrs. Ball Bros., by Mr. W. Stockdale; conversion of dwellings into shops and offices, West Percy-street and Bedford-street, for Mr. J. Vert, by Mr. J. R. Wallace; four houses, Stanwick-street, Tynemouth, for Messrs. B. Peel, Ltd., by Mr. W. Stockdale; semi-detached houses, Cleveland-road for Mr. W. Bower, by Mr. W. Stockdale.

WALTON.—To strengthen the county bridge the Middlesex C.C. is to construct a concrete raft on the southern approach and tye the spandril walls at a cost of £800.

WARRINGTON.—The T.C. is preparing plans for 54 houses on the Reynolds-street site. Three houses for firemen are to be erected in Cambria-place. Alterations are to be made at the Technical School, at a cost of £3,000. Plans have been prepared by the B.S. for a bridge across the river near Manor Lock, in order to facilitate town development. Plans passed: Wesleyan church and schools, Ellesmere-street, for Trustees, Ellesmere-street Wesleyan Church; house, Alexandra-street, for Mr. A. Harter; sub-station, Kerfoot-street (behind), for Warrington Corporation (Electricity Committee); single-story building on Nora-street, for The Firth Co., Ltd.; butcher's shop and loading yard, &c., Cairo-street, for Warrington E.I. Co-operative Society; pavilion on Recreation Ground, Gorsey-lane, for Messrs. Rylands Workmen's Recreation Club.

WEST BRIDGFORD.—10 Allotments in Loughborough-road, Chantry-road and Carlisle-road are now to be developed for building purposes.

WHICKHAM.—Messrs. Adams have submitted to the U.D.C. plans for two shops on land on the Gateshead-Hexham main road at Swalwell, and negotiations are taking place regarding the building line.

YORK.—Plans passed by T.C.: E. Relton, two houses, Carrington-avenue; G. Forster, house, Moorgate; J. Terry & Sons, Ltd., bottle store, &c., Vine-street; C. Martin, Ltd., two houses, Beech-avenue, R. Johnston & Sons, six houses, Beech-avenue; T. Harrison, two houses, Hull-road; York Equitable Industrial Society, Ltd., alterations, Holgate-road.
